$$\begin{array}{ccc} \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) & \longrightarrow & \underset{\longrightarrow}{\text{holim}}(\mathcal{G}) \\ \downarrow & & \downarrow \\ \overline{\mathcal{F}}(\mathbf{1}) & \longrightarrow & \overline{\mathcal{G}}(\mathbf{1}) \end{array}$$

where the upper horizontal map is a weak homotopy equivalence (Proposition 5.3.2.18). The desired result now follows from the two-out-of-three property (Remark 3.1.6.16). \square

There is a close relationship between homotopy colimit diagrams (in the sense of Definition 7.5.7.3) and homotopy limit diagrams (in the sense of Definition 7.5.4.1).

Proposition 7.5.7.6. *Let \mathcal{C} be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram if and only if, for every Kan complex X , the functor*

$$X^{\overline{\mathcal{F}}} : (\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \text{Kan} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), X)$$

is a homotopy limit diagram.

Proof. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, let $\mathbf{1}$ denote the final object of $\mathcal{C}^\triangleright$, and let $\theta : \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \rightarrow \overline{\mathcal{F}}(\mathbf{1})$ be the map appearing in Definition 7.5.7.3. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram if and only if, for every Kan complex X , precomposition with θ induces a homotopy equivalence of Kan complexes

$$\theta^* : \text{Fun}(\overline{\mathcal{F}}(\mathbf{1}), X) \rightarrow \text{Fun}(\underset{\longrightarrow}{\text{holim}}(\mathcal{F}), X).$$

Setting $\mathcal{G} = \mathcal{F}^{\text{op}}$, $\overline{\mathcal{G}} = \overline{\mathcal{F}}^{\text{op}}$, and $Y = X^{\text{op}}$, Example 7.5.1.7 identifies θ^* with the opposite of the restriction map $Y^{\overline{\mathcal{G}}}(\mathbf{1}) \rightarrow \underset{\longleftarrow}{\text{holim}}(Y^{\mathcal{G}})$ appearing in Definition 7.5.4.1. In particular, θ^* is a homotopy equivalence if and only if $Y^{\overline{\mathcal{G}}}$ is a homotopy limit diagram of Kan complexes.

By virtue of Corollary 7.5.4.12, this is equivalent to the requirement that $X^{\overline{\mathcal{F}}}$ is a homotopy limit diagram. \square

- 03CU **Corollary 7.5.7.7.** *Let \mathcal{C} be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram (in the sense of Definition 7.5.7.3) if and only if the induced functor of ∞ -categories*

$$N_\bullet^{\text{hc}}(\overline{\mathcal{F}}) : N_\bullet(\mathcal{C}^\triangleright) \rightarrow N_\bullet^{\text{hc}}(\text{Kan}) = \mathcal{S}$$

is a colimit diagram (in the sense of Variant 7.1.2.5).

Proof. Combine Proposition 7.5.7.6 with Corollary 7.5.4.6 (applied to the simplicial category Kan^{op}). \square

- 03CV **Corollary 7.5.7.8.** *Let \mathcal{C} be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a functor. Let $\overline{\mathcal{F}}^{\text{op}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be the functor given on objects by $\overline{\mathcal{F}}^{\text{op}}(C) = \overline{\mathcal{F}}(C)^{\text{op}}$. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram if and only if $\overline{\mathcal{F}}^{\text{op}}$ is a homotopy colimit diagram.*

Proof. Combine Proposition 7.5.7.6 with Corollary 7.5.7.8. \square

- 03CW **Corollary 7.5.7.9.** *Suppose we are given a commutative diagram of simplicial sets*

03CX

$$\begin{array}{ccc} A & \longrightarrow & A_0 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A_{01}, \end{array} \tag{7.48}$$

which we identify with a functor $\mathcal{F} : [1] \times [1] \rightarrow \text{Set}_\Delta$. Then (7.48) is a homotopy pushout square (in the sense of Definition 3.4.2.1) if and only if \mathcal{F} is a homotopy colimit diagram (in the sense of Definition 7.5.7.3).

Proof. Combine Propositions 7.5.7.6 and 7.5.4.13. \square

7.5.8 Categorical Colimit Diagrams

- 03CY In §7.5.7, we introduced the notion of a *homotopy colimit diagram* (Definition 7.5.7.3), and showed that one can use homotopy colimit diagrams to compute colimits in the ∞ -category \mathcal{S} of spaces (Corollary 7.5.7.7). In this section, we introduce the closely related notion of *categorical colimit diagram*, which can be used to compute colimits in the larger ∞ -category $\mathcal{QC} \supset \mathcal{S}$.

Proposition 7.5.8.1. *Let \mathcal{C} be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \text{QCat}$ be a (strictly commutative) diagram of ∞ -categories indexed by \mathcal{C} , and let W denote the collection of horizontal edges of the homotopy colimit $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ (Definition 5.3.4.1). Then an ∞ -category \mathcal{D} is a colimit of the diagram*

$$N_{\bullet}^{\text{hc}}(\mathcal{F}) : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}^{\text{hc}}(\text{QCat}) = \mathcal{QC}$$

if and only if it is a localization of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ with respect to W , in the sense of Remark 6.3.2.2.

Proof. Let $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ be the projection map of Definition 5.3.3.1 and let W' denote the collection of all U -cocartesian morphisms of $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$. Choose a functor of ∞ -categories $T : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow \mathcal{D}$ which exhibits \mathcal{D} as a localization of $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ with respect to W' . Let $\lambda_t : \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \rightarrow N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ denote the taut scaffold of Construction 5.3.4.11. Then λ_t is a categorical equivalence of simplicial sets (Corollary 5.3.5.9). Moreover, a morphism of $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ belongs to W' if and only if it is isomorphic (as an object of the ∞ -category $\text{Fun}(\Delta^1, N_{\bullet}^{\mathcal{F}}(\mathcal{C}))$) to an element of $\lambda_t(W)$ (see Corollary 5.3.3.16). It follows that the composite map $\underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \xrightarrow{\lambda_t} N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \xrightarrow{T} \mathcal{D}$ exhibits \mathcal{D} as a localization of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ with respect to W . We conclude by observing that \mathcal{D} is a colimit of the diagram $N_{\bullet}^{\text{hc}}(\mathcal{F})$ (Corollary 7.4.3.16). \square

Motivated by Proposition 7.5.8.1, we introduce the following variant of Definition 7.5.7.3:

Definition 7.5.8.2. *Let \mathcal{C} be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \text{Set}_{\Delta}$ be a diagram of simplicial sets. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, and let W denote the collection of horizontal edges of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ (Definition 5.3.4.1). We will say that $\overline{\mathcal{F}}$ is a *categorical colimit diagram* if the composite map*

$$\underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \twoheadrightarrow \underset{\longrightarrow}{\lim}(\mathcal{F}) \rightarrow \overline{\mathcal{F}}(\mathbf{1})$$

exhibits $\overline{\mathcal{F}}(\mathbf{1})$ as a localization of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ with respect to W . (see Definition 6.3.1.9). Here $\mathbf{1}$ denotes the final object of the cone $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{\mathbf{1}\}$, and the morphism on the left is the comparison map of Remark 5.3.2.9.

Remark 7.5.8.3. *Let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \text{Set}_{\Delta}$ be a categorical colimit diagram of simplicial sets. Then $\overline{\mathcal{F}}$ is also a homotopy colimit diagram of simplicial sets, in the sense of Definition 7.5.7.3. This follows from the observation that every localization of simplicial sets is a weak homotopy equivalence (Remark 6.3.1.16).*

Proposition 7.5.8.4. *Let \mathcal{C} be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \text{Set}_{\Delta}$ be a diagram of simplicial sets. The following conditions are equivalent:*

- (1) *The diagram $\overline{\mathcal{F}}$ is a categorical colimit diagram.*

(2) For every ∞ -category \mathcal{D} , the diagram of ∞ -categories

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \text{QCat} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})$$

is a categorical limit diagram (Definition 7.5.5.1).

(3) For every ∞ -category \mathcal{D} , the diagram of Kan complexes

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \text{Kan} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})^\simeq$$

is a homotopy limit diagram (Definition 7.5.4.1).

Proof. The equivalence of (1) and (2) follows by combining Example 7.5.2.11 with Corollary 7.5.5.15. The equivalence with (3) follows by combining the same results with Proposition 6.3.1.13 and Example 7.5.2.8. \square

03D3 **Corollary 7.5.8.5.** Suppose we are given a commutative diagram of simplicial sets

03D4

$$\begin{array}{ccc} A & \longrightarrow & A_0 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A_{01}, \end{array} \tag{7.49}$$

which we identify with a functor $\mathcal{F} : [1] \times [1] \rightarrow \text{Set}_\Delta$. Then (7.49) is a categorical pushout square (in the sense of Definition 4.5.4.1) if and only if \mathcal{F} is a categorical colimit diagram (in the sense of Definition 7.5.8.2).

03D5 **Corollary 7.5.8.6** (Homotopy Invariance). Let \mathcal{C} be a category and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ be a natural transformation between diagrams $\overline{\mathcal{F}}, \overline{\mathcal{G}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is a categorical equivalence of simplicial sets. Then any two of the following conditions imply the third:

- (1) The functor $\overline{\mathcal{F}}$ is a categorical colimit diagram.
- (2) The functor $\overline{\mathcal{G}}$ is a categorical colimit diagram.
- (3) The natural transformation α induces a categorical equivalence $\overline{\mathcal{F}}(\mathbf{1}) \rightarrow \overline{\mathcal{G}}(\mathbf{1})$, where $\mathbf{1}$ denotes the cone point of $\mathcal{C}^\triangleright$.

Proof. By virtue of Proposition 7.5.8.4 (and Proposition 4.5.3.8), it will suffice to show that for every ∞ -category \mathcal{D} , any two of the following conditions imply the third:

(1_D) The functor

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \text{QCat} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})$$

is a categorical limit diagram.

(2_D) The functor

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \text{QCat} \quad C \mapsto \text{Fun}(\overline{\mathcal{G}}(C), \mathcal{D})$$

is a categorical limit diagram.

(3_D) The natural transformation α induces an equivalence of ∞ -categories $\text{Fun}(\overline{\mathcal{G}}(\mathbf{1}), \mathcal{D}) \xrightarrow{\sim} \text{Fun}(\overline{\mathcal{F}}(\mathbf{1}), \mathcal{D})$.

This follows from Remark 7.5.5.6. \square

Corollary 7.5.8.7. *Let \mathcal{C} be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a colimit diagram 03D6 in the category of simplicial sets. If the diagram $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ is projectively cofibrant, then $\overline{\mathcal{F}}$ is a categorical colimit diagram.*

Proof. Let \mathcal{D} be an ∞ -category and define $\overline{\mathcal{G}} : (\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \text{QCat}$ by the formula $\overline{\mathcal{G}}(C) = \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})$. By virtue of Proposition 7.5.8.4, it will suffice to show that the diagram of Kan complexes $\widetilde{\overline{\mathcal{G}}}$ is a homotopy limit diagram. Setting $\mathcal{G} = \overline{\mathcal{G}}|_{\mathcal{C}^{\text{op}}}$, our assumption that \mathcal{F} is projectively cofibrant guarantees that the diagram \mathcal{G} is isofibrant (Remark 7.5.6.6). It follows that the diagram of Kan complexes $\widetilde{\mathcal{G}}$ is also isofibrant, and that $\widetilde{\overline{\mathcal{G}}}$ is a limit diagram (Corollary 4.5.6.19). The desired result now follows from Example 7.5.4.2. \square

Corollary 7.5.8.8. *Let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets, let $\theta : \text{holim}(\mathcal{F}) \rightarrow \varinjlim(\mathcal{F})$ be the comparison map of Remark 5.3.2.9, and let W denote the collection of all horizontal edges of the homotopy colimit $\text{holim}(\mathcal{F})$ (Definition 5.3.4.1). If \mathcal{F} is projectively cofibrant (Definition 7.5.6.1), then θ exhibits $\varinjlim(\mathcal{F})$ as a localization of $\text{holim}(\mathcal{F})$ with respect to W . 03D7*

Proof. This is a restatement of Corollary 7.5.8.7. \square

Corollary 7.5.8.9. *Let \mathcal{C} be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{QCat}$ be a diagram of ∞ -categories 03D8. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram (in the sense of Definition 7.5.7.3) if and only if the induced functor of ∞ -categories*

$$N_\bullet^{\text{hc}}(\overline{\mathcal{F}}) : N_\bullet(\mathcal{C}^\triangleright) \rightarrow N_\bullet^{\text{hc}}(\text{QCat}) = \mathcal{QC}$$

is a colimit diagram (in the sense of Variant 7.1.2.5).

Proof. Combine Proposition 7.5.8.4 with Corollary 7.5.4.6 (applied to the simplicial category QCat^{op}). \square

03D9 **Corollary 7.5.8.10.** *Let \mathcal{C} be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram if and only if it is a homotopy colimit diagram.*

Proof. Combine Corollary 7.5.8.9, Corollary 7.5.7.7, and Proposition 7.4.5.1. \square

03DA **Corollary 7.5.8.11.** *Let \mathcal{C} be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a functor. Let $\overline{\mathcal{F}}^{\text{op}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be the functor given on objects by $\overline{\mathcal{F}}^{\text{op}}(C) = \overline{\mathcal{F}}(C)^{\text{op}}$. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram if and only if $\overline{\mathcal{F}}^{\text{op}}$ is a categorical colimit diagram.*

Proof. Combine Proposition 7.5.8.4 with Corollary 7.5.5.15. \square

We close this section with an application of the formalism of categorical colimit diagrams.

03DB **Proposition 7.5.8.12** (Rewriting Colimits). *Let \mathcal{C} be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a categorical colimit diagram which carries the final object of $\mathcal{C}^\triangleright$ to a simplicial set K . Let \mathcal{D} be an ∞ -category equipped with a diagram $q : K \rightarrow \mathcal{D}$ satisfying the following condition:*

(*) *For each object $C \in \mathcal{C}$, the composite map*

$$q_C : \overline{\mathcal{F}}(C) \rightarrow K \xrightarrow{q} \mathcal{D}$$

admits a colimit in the ∞ -category \mathcal{D} .

Then there exists a functor $Q : N_\bullet(\mathcal{C}) \rightarrow \mathcal{D}$ with the following properties:

- (1) *For each object $C \in \mathcal{C}$, the object $Q(C) \in \mathcal{D}$ is a colimit of the diagram q_C .*
- (2) *An object $X \in \mathcal{D}$ is a colimit of the diagram q if and only if it is a colimit of Q . In particular, the diagram q has a colimit in \mathcal{D} if and only if the diagram Q has a colimit in \mathcal{D} .*
- (3) *Let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories which preserves the colimit of each of the diagrams q_C , and suppose that the diagrams q and Q admit colimits in \mathcal{D} . Then G preserves the colimit of q if and only if it preserves the colimit of Q .*

Proof. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, let $U : \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \rightarrow N_\bullet(\mathcal{C})$ be the projection map, and let W be the collection of all horizontal edges of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$. The diagram $\overline{\mathcal{F}}$ then determines a morphism of simplicial sets $T : \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \rightarrow K$ which exhibits K as a localization of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ with respect to W . It follows from assumption (*) that for each object $C \in \mathcal{C}$, the composite map

$$\mathcal{F}(C) \simeq \{C\} \times_{N_\bullet(\mathcal{C})} \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \hookrightarrow \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \xrightarrow{T} K \xrightarrow{q} \mathcal{D}$$

admits a colimit in \mathcal{D} . Applying Corollary 7.3.5.3, we conclude that there is a functor $Q : N_\bullet(\mathcal{C}) \rightarrow \mathcal{D}$ and a natural transformation $\beta : T \circ q \rightarrow Q \circ U$ which exhibits Q as a left

Kan extension of $T \circ q$ along U . We will complete the proof by showing that Q satisfies conditions (1), (2), and (3) of Proposition 7.5.8.12. Condition (1) follows immediately from Remark 7.3.5.4.

We now prove (2). Assume first that $X \in \mathcal{D}$ is a colimit of the diagram Q . For every simplicial set S , we let \underline{X}_S denote the image of X in the ∞ -category $\text{Fun}(S, \mathcal{D})$. Choose a natural transformation $\alpha : Q \rightarrow \underline{X}_{N_{\bullet}(\mathcal{C})}$ which exhibits $X \in \mathcal{D}$ as a colimit of the diagram Q , let $\tilde{\alpha} : Q \circ U \rightarrow \underline{X}_{\text{holim}(\mathcal{F})}$ denote the image of α in $\text{Fun}(\text{holim}(\mathcal{F}), \mathcal{D})$, and let $\tilde{\gamma} : q \circ T \rightarrow \underline{X}_{\text{holim}(\mathcal{F})} = \underline{X}_K \circ \overrightarrow{T}$ be a composition of β with $\tilde{\alpha}$ in $\text{Fun}(\text{holim}(\mathcal{F}), \mathcal{D})$. Since precomposition with T induces a fully faithful functor $\text{Fun}(K, \mathcal{D}) \rightarrow \text{Fun}(\text{holim}(\mathcal{F}), \mathcal{D})$, we may assume without loss of generality that $\tilde{\gamma}$ is the image of a natural transformation $\gamma : q \rightarrow \underline{X}_K$. Note that $\tilde{\gamma}$ exhibits X as a colimit of the diagram $q \circ T$ (Corollary 7.3.8.20). Since T is right cofinal (Proposition 7.2.1.10), it follows that γ exhibits X as a colimit of the diagram q (Corollary 7.2.2.7).

To prove the reverse implication, it will suffice to show that if the diagram $q : K \rightarrow \mathcal{D}$ admits a colimit, then Q also admits a colimit. Since T is right cofinal, the diagram $q \circ T$ also admits a colimit in \mathcal{D} (Corollary 7.2.2.11), so the desired result is immediate from Corollary 7.3.8.20.

We now prove (3). Let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories which preserves the colimit of the diagram q_C , for each object $C \in \mathcal{C}$. Let $\alpha : Q \rightarrow \underline{X}_{N_{\bullet}(\mathcal{C})}$ and $\gamma : q \rightarrow \overline{X}_K$ be defined as above; we wish to show that $G(\alpha)$ exhibits $G(X)$ as a colimit of the diagram $G \circ Q$ if and only if $G(\gamma)$ exhibits $G(X)$ as a colimit of the diagram $G \circ q$. Using Corollary 7.2.2.7, we see that latter condition is equivalent to the requirement that $G(\tilde{\gamma})$ exhibits $G(X)$ as a colimit of the diagram $G \circ q \circ T$. By virtue of Corollary 7.3.8.20, we are reduced to showing that the natural transformation $G(\beta)$ exhibits $G \circ Q$ as a left Kan extension of $G \circ q \circ T$ along U . This follows from the criterion of Remark 7.3.5.4. \square

Corollary 7.5.8.13. *Let \mathcal{C} be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \text{Set}_{\Delta}$ be a categorical colimit diagram carrying the final object of $\mathcal{C}^{\triangleright}$ to a simplicial set K . Let \mathcal{D} be an ∞ -category which admits $N_{\bullet}(\mathcal{C})$ -indexed colimits and $\overline{\mathcal{F}}(C)$ -indexed colimits, for each object $C \in \mathcal{C}$. Then \mathcal{D} also admits K -indexed colimits. Moreover, if $G : \mathcal{D} \rightarrow \mathcal{E}$ is a functor of ∞ -categories which preserves $N_{\bullet}(\mathcal{C})$ -indexed colimits and $\overline{\mathcal{F}}(C)$ -indexed colimits for each $C \in \mathcal{C}$, then G also preserves K -indexed colimits.*

7.5.9 Application: Filtered Colimits of ∞ -Categories

Let \mathcal{C} be a small filtered category, let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_{\Delta}$ be a diagram, and let $\mathcal{E} = \varinjlim(\mathcal{F})$ denote the colimit of \mathcal{F} in the category of simplicial sets. If each of the simplicial sets $\mathcal{F}(C)$ is an ∞ -category, then the simplicial set \mathcal{E} is also an ∞ -category (Remark 1.3.0.9). Our goal

in this section is to show that, in this case, we can also regard \mathcal{E} as a colimit of the diagram $N_\bullet^{\text{hc}}(\mathcal{F}) : N_\bullet(\mathcal{C}) \rightarrow \mathcal{QC}$. This is a consequence of the following more general result:

03DE **Proposition 7.5.9.1.** *Let \mathcal{C} be a small filtered category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a colimit diagram in the category of simplicial sets. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram.*

03DF **Remark 7.5.9.2.** Let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets and let W denote the collection of horizontal edges of the homotopy colimit $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$. Proposition 7.5.9.1 asserts that, if the category \mathcal{C} is filtered, then the comparison map $\theta : \underset{\longrightarrow}{\text{holim}}(\mathcal{F}) \rightarrow \underset{\longrightarrow}{\lim}(\mathcal{F})$ exhibits $\underset{\longrightarrow}{\lim}(\mathcal{F})$ as a localization of $\underset{\longrightarrow}{\text{holim}}(\mathcal{F})$ with respect to W . In particular, θ is a weak homotopy equivalence.

Before giving the proof of Proposition 7.5.9.1, let us record some of its consequences.

03DG **Corollary 7.5.9.3.** *Let \mathcal{C} be a small filtered category. Then the inclusion map*

$$N_\bullet(\text{QCat}) \hookrightarrow N_\bullet^{\text{hc}}(\text{QCat}) = \mathcal{QC}$$

preserves $N_\bullet(\mathcal{C})$ -indexed colimits.

Proof. We first observe that the full subcategory $\text{QCat} \subseteq \text{Set}_\Delta$ is closed under filtered colimits (Remark 1.3.0.9), so the category QCat admits \mathcal{C} -indexed colimits. Fix a colimit diagram $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{QCat}$ in the ordinary category QCat . We wish to show that the induced map $N_\bullet^{\text{hc}}(\mathcal{F}) : N_\bullet(\mathcal{C}) \rightarrow \mathcal{QC}$ is a colimit diagram in the ∞ -category \mathcal{QC} . By virtue of Corollary 7.5.8.9, this is equivalent to the requirement that $\overline{\mathcal{F}}$ is a categorical colimit diagram, which follows from Proposition 7.5.9.1. \square

03DH **Variant 7.5.9.4.** Let \mathcal{C} be a small filtered category. Then the inclusion map

$$N_\bullet(\text{Kan}) \hookrightarrow N_\bullet^{\text{hc}}(\text{Kan}) = \mathcal{S}$$

preserves $N_\bullet(\mathcal{C})$ -indexed colimits.

03DJ **Corollary 7.5.9.5.** *Let \mathcal{C} be a small filtered category and let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets having colimit $K = \underset{\longrightarrow}{\lim}(\mathcal{F})$. Let \mathcal{D} be an ∞ -category which admits $N_\bullet(\mathcal{C})$ -indexed colimits and which admits $\mathcal{F}(C)$ -indexed colimits, for each $C \in \mathcal{C}$. Then \mathcal{D} also admits K -indexed colimits. Moreover, if $G : \mathcal{D} \rightarrow \mathcal{E}$ is a functor which preserves both $N_\bullet(\mathcal{C})$ -indexed colimits and $\mathcal{F}(C)$ -indexed colimits for each $C \in \mathcal{C}$, then G also preserves K -indexed colimits.*

Proof. Combine Proposition 7.5.9.1 with Corollary 7.5.8.13. \square

Corollary 7.5.9.6. *Let \mathcal{D} be an ∞ -category which admits finite colimits and small filtered colimits. Then \mathcal{D} admits all small colimits. Moreover, if $G : \mathcal{D} \rightarrow \mathcal{E}$ is a functor of ∞ -categories which preserves finite colimits and small filtered colimits, then G preserves all small colimits.*

Proof. This is a special case of Corollary 7.5.9.5, since every small simplicial set K can be realized as a (small) filtered colimit of finite simplicial sets. For example, we can write K as the union of all finite simplicial subsets of itself. \square

Our proof of Proposition 7.5.9.1 will require a brief digression. Let \mathcal{C} be a small category and let $\mathcal{G} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets. In §7.5.6, we showed that there exists a projectively cofibrant diagram $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ equipped with a levelwise weak homotopy equivalence $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ (Proposition 7.5.6.9). Using a somewhat less explicit construction, we can obtain a better approximation to \mathcal{G} :

Proposition 7.5.9.7. *Let \mathcal{C} be a small category and let $\mathcal{G} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets. Then there exists a projectively cofibrant diagram $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ and a levelwise trivial Kan fibration $\alpha : \mathcal{F} \rightarrow \mathcal{G}$.*

Proof of Proposition 7.5.9.1 from Proposition 7.5.9.7. Let \mathcal{C} be a small filtered category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a colimit diagram in the category of simplicial sets; we wish to show that $\overline{\mathcal{F}}$ is a categorical colimit diagram. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$. Using Proposition 7.5.9.7, we can choose a levelwise categorical equivalence $\alpha : \mathcal{E} \rightarrow \mathcal{F}$, where $\mathcal{E} : \mathcal{C} \rightarrow \text{Set}_\Delta$ is projectively cofibrant. Let $\overline{\mathcal{E}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a colimit diagram extending \mathcal{E} , so that α extends uniquely to a natural transformation $\overline{\alpha} : \overline{\mathcal{E}} \rightarrow \overline{\mathcal{F}}$. Applying Corollary 4.5.7.2, we deduce that $\overline{\alpha}$ is also a levelwise categorical equivalence. Consequently, to show that $\overline{\mathcal{F}}$ is a categorical colimit diagram, it will suffice to show that $\overline{\mathcal{E}}$ is a categorical colimit diagram (Corollary 7.5.8.6). This follows from Corollary 7.5.8.7, since \mathcal{E} is projectively cofibrant. \square

It will be useful to formulate a slightly stronger version of Proposition 7.5.9.7. First, we need some terminology.

Definition 7.5.9.8. Let \mathcal{C} be a small category and let $\alpha : \mathcal{F}' \rightarrow \mathcal{F}$ be a natural transformation between diagrams $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \text{Set}_\Delta$. We say that α is a *projective cofibration* if it has the left lifting property with respect to all levelwise trivial Kan fibrations (see Remark 4.5.6.2). That is, α is a projective cofibration if every lifting problem

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{\quad} & \mathcal{G}' \\ \downarrow \alpha & \nearrow \text{dashed} & \downarrow \beta \\ \mathcal{F} & \xrightarrow{\quad} & \mathcal{G} \end{array}$$

admits a solution, under the assumption that β is a levelwise trivial Kan fibration between diagrams $\mathcal{G}, \mathcal{G}' : \mathcal{C} \rightarrow \text{Set}_\Delta$.

03DN **Example 7.5.9.9.** Let \mathcal{C} be a small category. Then a diagram of simplicial sets $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ is projectively cofibrant (in the sense of Definition 7.5.6.1) if and only if the unique natural transformation $\underline{\emptyset} \rightarrow \mathcal{F}$ is a projective cofibration (in the sense of Definition 7.5.9.8). Here $\underline{\emptyset} : \mathcal{C} \rightarrow \text{Set}_\Delta$ denotes the initial object of the category $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)$, which carries every object of \mathcal{C} to the empty simplicial set.

03DP **Example 7.5.9.10.** Let \mathcal{C} be a small category. For each object $C \in \mathcal{C}$, let $h^C : \mathcal{C} \rightarrow \text{Set}$ denote the functor corepresented by C (given on objects by the formula $h^C(D) = \text{Hom}_{\mathcal{C}}(C, D)$). If $A \hookrightarrow B$ is a monomorphism of simplicial sets, then the natural transformation $\underline{A} \times h^C \hookrightarrow \underline{B} \times h^C$ is a projective cofibration in $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)$; here \underline{A} and \underline{B} denote the constant simplicial sets taking the values A and B , respectively.

03DQ **Remark 7.5.9.11.** Let \mathcal{C} be a small category. Then the collection of projective cofibrations in $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)$ is weakly saturated, in the sense of Definition 1.4.4.15. That is, it is closed under retracts, pushouts, and transfinite composition. See Proposition 1.4.4.16.

03DR **Proposition 7.5.9.12.** *Let \mathcal{C} be a small category and let $\alpha_0 : \mathcal{F}_0 \rightarrow \mathcal{G}$ be a natural transformation between diagrams $\mathcal{F}_0, \mathcal{G} : \mathcal{C} \rightarrow \text{Set}_\Delta$. Then α_0 factors as a composition*

$$\mathcal{F}_0 \xrightarrow{\beta} \mathcal{F} \xrightarrow{\alpha} \mathcal{G},$$

where β is a projective cofibration and α is a levelwise trivial Kan fibration.

Proof. We will construct \mathcal{F} as the colimit of a diagram of projective cofibrations

$$\mathcal{F}_0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow \cdots$$

in the category $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)_{/\mathcal{G}}$. Fix $n \geq 0$, and suppose that we have constructed an object $\mathcal{F}_n \in \text{Fun}(\mathcal{C}, \text{Set}_\Delta)_{/\mathcal{G}}$, which we identify with a natural transformation $\alpha_n : \mathcal{F}_n \rightarrow \mathcal{G}$. For each object $C \in \mathcal{C}$, Exercise 3.1.7.10 guarantees that $\alpha_{n,C}$ factors as a composition

$$\mathcal{F}_n(C) \xrightarrow{\alpha'_{n,C}} \mathcal{F}'_n(C) \xrightarrow{\alpha''_{n,C}} \mathcal{G}(C),$$

where $\alpha'_{n,C}$ is a monomorphism and $\alpha''_{n,C}$ is a trivial Kan fibration (beware that $\mathcal{F}'_n(C)$ does not depend functorially on C). Form a pushout diagram

$$\begin{array}{ccc} \coprod_{C \in \mathcal{C}} \mathcal{F}_n(C) \times h^C & \longrightarrow & \coprod_{C \in \mathcal{C}} \mathcal{F}'_n(C) \times h^C \\ \downarrow & & \downarrow \\ \mathcal{F}_n & \longrightarrow & \mathcal{F}_{n+1} \end{array}$$

in the category $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)_{/\mathcal{G}}$, where the upper horizontal map is the coproduct of the projective cofibrations described in Example 7.5.9.10. Using Remark 7.5.9.11, we see that each of the maps

$$\mathcal{F}_0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow \dots$$

is a projective cofibration. Setting $\mathcal{F} = \varinjlim_n \mathcal{F}_n$, we obtain a factorization of α_0 as a composition $\mathcal{F}_0 \xrightarrow{\beta} \mathcal{F} \xrightarrow{\alpha} \mathcal{G}$, where β is a projective cofibration. We complete the proof by observing that for each object $C \in \mathcal{C}$, the morphism $\alpha_C : \mathcal{F}(C) \rightarrow \mathcal{G}(C)$ is a trivial Kan fibration, since it can be written as a filtered colimit (in the arrow category $\text{Fun}([1], \text{Set}_\Delta)$) of the trivial cofibrations $\alpha''_{n,C} : \mathcal{F}'_n(C) \rightarrow \mathcal{G}(C)$ (see Remark 1.4.5.3). \square

Proof of Proposition 7.5.9.7. Apply Proposition 7.5.9.12 in the special case $\mathcal{F}_0 = \emptyset$ (see Example 7.5.9.9). \square

Corollary 7.5.9.13. *Let \mathcal{C} be a small category, and let S be the collection of all projective cofibrations in the category $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)$. Then S is the smallest weakly saturated collection of morphisms which contains each of the inclusion maps $\iota_{n,C} : \underline{\partial\Delta}^n \times h^C \hookrightarrow \underline{\Delta}^n \times h^C$, for each $n \geq 0$ and each object $C \in \mathcal{C}$.*

Proof. It follows from Remark 7.5.9.11 that S is weakly saturated. Let S' be the smallest weakly saturated collection of morphisms of $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)$ which contains each $\iota_{n,C}$. Using Example 7.5.9.10, we see that S' is contained in S . For every monomorphism of simplicial sets $A \hookrightarrow B$ and every object $C \in \mathcal{C}$, Proposition 1.4.5.13 guarantees that the projective cofibration $\underline{A} \times h^C \hookrightarrow \underline{B} \times h^C$ is contained in S' . It follows from the proof of Proposition 7.5.9.12 that every morphism $\alpha_0 : \mathcal{F}_0 \rightarrow \mathcal{G}$ in $\text{Fun}(\mathcal{C}, \text{Set}_\Delta)$ factors as a composition $\mathcal{F}_0 \xrightarrow{\beta} \mathcal{F} \xrightarrow{\alpha} \mathcal{G}$, where β belongs to S' and α is a trivial Kan fibration. If α_0 is projective cofibration, then the lifting problem

$$\begin{array}{ccc} \mathcal{F}_0 & \xrightarrow{\beta} & \mathcal{F} \\ \downarrow \alpha_0 & \nearrow & \downarrow \alpha \\ \mathcal{G} & \xlongequal{\quad} & \mathcal{G} \end{array}$$

admits a solution. It follows that α_0 is a retract of the morphism β , and therefore belongs to S' . \square

7.6 Examples of Limits and Colimits

Let \mathcal{C} be an ∞ -category. In §7.1, we introduced the notion of limit and colimit for an arbitrary morphism of simplicial sets $\sigma : K \rightarrow \mathcal{C}$. Our goal in this section is to make the general theory more explicit for some special classes of diagrams which arise frequently in practice.

We begin in §7.6.1 by considering the case where K is a *discrete* simplicial set. In this case, specifying a functor $\sigma : K \rightarrow \mathcal{C}$ is equivalent to specifying a collection of objects $\{Y_k \in \mathcal{C}\}_{k \in K}$, indexed by the collection of vertices of K . We say that an object of \mathcal{C} is a *product* of the collection $\{Y_k\}_{k \in K}$ if it is a limit of the diagram σ , and a *coproduct* of the collection $\{Y_k\}_{k \in K}$ if it is a colimit of the diagram σ . These conditions can be formulated purely in terms of the homotopy category $h\mathcal{C}$, provided that we regard $h\mathcal{C}$ as enriched over the homotopy category of Kan complexes $h\text{Kan}$ (see Remark 7.6.1.5). In particular, the forgetful functor from \mathcal{C} to (the nerve of) its homotopy category $h\mathcal{C}$ preserves products and coproducts (Warning 7.6.1.2).

In §7.6.2, we allow K to be an arbitrary simplicial set, but require $\sigma : K \rightarrow \mathcal{C}$ to be a constant diagram taking some value $Y \in \mathcal{C}$. In this case, we will denote a limit of σ (if it exists) by Y^K and a colimit of σ (if it exists) by $K \otimes Y$ (Notation 7.6.2.5). We refer to Y^K as a *power of Y by K* , and $K \otimes Y$ as a *tensor product of Y by K* . These notions can again be formulated purely at the level of the homotopy category $h\mathcal{C}$, regarded as an $h\text{Kan}$ -enriched category (Definition 7.6.2.1 and Remark 7.6.2.6).

In §7.6.3, we study limit and colimit diagrams indexed by the simplicial set $K = \Delta^1 \times \Delta^1$. Let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a functor of ∞ -categories, which we depict as a diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

We say that σ is a *pullback square* if it is a limit diagram, and a *pushout square* if it is a colimit diagram (Definition 7.6.3.1). Beware that these conditions cannot be formulated at the level of the homotopy category $h\mathcal{C}$, even if its $h\text{Kan}$ -enrichment is accounted for: see Warning 7.6.3.3 Example 7.6.3.4.

It follows from Proposition 7.5.4.13 that a (strictly commutative) diagram of Kan complexes

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

determines a pullback square in the ∞ -category \mathcal{S} if and only if it is a homotopy pullback square. However, not every pullback square in the ∞ -category \mathcal{S} arises in this way. In §7.6.4, we give a detailed classification of *all* pullback squares in the ∞ -category \mathcal{S} (Corollary 7.6.4.10). In particular, for every pair of morphisms of Kan complexes $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$, we construct a pullback diagram

$$\begin{array}{ccc} X_0 \times_X^h X_1 & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in the ∞ -category \mathcal{S} (Example 7.6.4.11); beware that this diagram usually does not commute in the ordinary category of simplicial sets. Our analysis can be applied more generally to any ∞ -category which arises as the homotopy coherent nerve of a locally Kan simplicial category (Corollary 7.6.4.12); in particular, it can be applied to the ∞ -category $\mathcal{C} = \mathcal{QC}$ of small ∞ -categories (see Proposition 7.6.4.8 and Corollary 7.6.4.9).

Let $(\bullet \rightrightarrows \bullet)$ denote the simplicial set given by the coproduct $\Delta^1 \coprod_{\partial\Delta^1} \Delta^1$ (Notation 7.6.5.1). In §7.6.5, we study limits and colimits of diagrams indexed by $(\bullet \rightrightarrows \bullet)$. For any ∞ -category \mathcal{C} , functors $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{C}$ can be identified with pairs $f_0, f_1 : Y \rightarrow X$ of morphisms in \mathcal{C} having the same source and target. In this case, we denote a limit of σ (if it exists) by $\text{Eq}(f_0, f_1)$, and a colimit of σ (if it exists) by $\text{Coeq}(f_0, f_1)$ (Notation 7.6.5.5). We refer to $\text{Eq}(f_0, f_1)$ as an *equalizer* of the pair (f_0, f_1) , and to $\text{Coeq}(f_0, f_1)$ as a *coequalizer* of (f_0, f_1) (Definition 7.6.5.4). Beware that, as with pullbacks and pushouts, the notions of equalizer and coequalizer cannot be formulated purely in terms of the homotopy category $\text{h}\mathcal{C}$; in particular, the forgetful functor from \mathcal{C} to (the nerve of) its homotopy category need not preserve equalizers and coequalizers.

Let $\mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, endowed with its usual linear ordering. In §7.6.6, we study colimits of diagram $X : N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$, which we represent informally as

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \dots$$

In the special case where $\mathcal{C} = \mathcal{S}$ is the ∞ -category of spaces, we show that the colimit $\varinjlim X(n)$ (formed in the ordinary category of simplicial sets, using the transition morphisms f_i) is also a colimit in the ∞ -category \mathcal{S} (Variant 7.6.6.9). Similarly, if $Y : N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{S}$ is a diagram which we depict informally as

$$\dots \rightarrow Y(4) \xrightarrow{g_3} Y(3) \xrightarrow{g_2} Y(2) \xrightarrow{g_1} Y(1) \xrightarrow{g_0} Y(0),$$

then the usual inverse limit $\varprojlim Y(n)$ (formed in the category of simplicial sets, using the transition morphisms g_n) is also a limit in the ∞ -category \mathcal{S} , provided that each of the maps

g_n is a Kan fibration (Variant 7.6.6.11). These assertions have counterparts for sequential limits and colimits in the ∞ -category \mathcal{QC} : see Examples 7.6.6.8 and 7.6.6.10.

Though the classes of diagrams we study in this section are of a very restricted type, they are nonetheless useful for analyzing limits and colimits in general. If K is a complicated simplicial set which can be decomposed into simpler constituents, then we can often use Proposition 7.5.8.12 to reduce questions about K -indexed (co)limits to questions about (co)limits indexed by those constituents. We will consider several variants on this theme:

- If a simplicial set K decomposes as a disjoint union $\coprod_{j \in J} K_j$, then we can often rewrite K -indexed limits as products; see Proposition 7.6.1.17.
- If a simplicial set K fits into a categorical pushout diagram

$$\begin{array}{ccc} K_{01} & \longrightarrow & K_0 \\ \downarrow & & \downarrow \\ K_1 & \longrightarrow & K, \end{array}$$

then we can often rewrite K -indexed limits as pullbacks; see Proposition 7.6.3.20.

- If \mathcal{C} is an ∞ -category which admits finite products, then an equalizer of a pair of morphisms $f_0, f_1 : Y \rightarrow X$ (if it exists) is characterized by the existence of a pullback diagram

$$\begin{array}{ccc} \text{Eq}(f_0, f_1) & \longrightarrow & Y \\ \downarrow & & \downarrow (f_0, f_1) \\ X & \xrightarrow{\delta_X} & X \times X; \end{array}$$

see Proposition 7.6.5.22.

- If \mathcal{C} is an ∞ -category which admits finite products, then a pullback of a diagram $X_0 \xrightarrow{f_0} X \xleftarrow{f_1} X_1$ can be rewritten as the equalizer of a diagram $X_0 \times X_1 \rightrightarrows X$ (Proposition 7.6.5.23).
- If \mathcal{C} is an ∞ -category which admits countable products, then the limit of a tower

$$\cdots \rightarrow X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0)$$

can be rewritten as an equalizer $\text{Eq}(f, \text{id}_X)$, where X is the product $\prod_{n \geq 0} X(n)$ and $f : X \rightarrow X$ is the endomorphism of X determined by the sequence $\{f_n\}_{n \geq 0}$; see Proposition 7.6.6.16.

- If K is a simplicial set which can be written as the colimit of a sequence

$$K(0) \rightarrow K(1) \rightarrow K(2) \rightarrow K(3) \rightarrow \cdots,$$

then we can often rewrite K -indexed limits as sequential limits (Corollary 7.6.6.14).

By applying these observations iteratively, one can build arbitrarily complicated limits (and colimits) out of the constructions studied in this section. For example, we show that an ∞ -category \mathcal{C} admits finite limits if and only if it admits pullbacks and has a final object (Corollary 7.6.3.21).

7.6.1 Products and Coproducts

We now study limits and colimits of diagrams which are indexed by *discrete* simplicial sets. In this case, the definitions of limit and colimit can be formulated entirely at the level of the (enriched) homotopy category.

Definition 7.6.1.1. Let hKan denote the homotopy category of Kan complexes and let \mathcal{C} be an hKan -enriched category. We say that a collection of morphisms $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ of \mathcal{C} exhibits Y as an hKan -enriched product of the collection $\{Y_i\}_{i \in I}$ if, for every object $X \in \mathcal{C}$, the collection of maps $\underline{\text{Hom}}_{\mathcal{C}}(X, Y) \xrightarrow{q_i \circ} \underline{\text{Hom}}_{\mathcal{C}}(X, Y_i)$ induces an isomorphism

$$\underline{\text{Hom}}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \underline{\text{Hom}}_{\mathcal{C}}(X, Y_i)$$

in the homotopy category hKan .

We say that a collection of morphisms $\{e_i : Y_i \rightarrow Y\}_{i \in I}$ exhibits Y as an hKan -enriched coproduct of the collection $\{Y_i\}_{i \in I}$ if, for every object $Z \in \mathcal{C}$, the collection of maps $\underline{\text{Hom}}_{\mathcal{C}}(Y, Z) \xrightarrow{\circ e_i} \underline{\text{Hom}}_{\mathcal{C}}(Y_i, Z)$ induces an isomorphism

$$\underline{\text{Hom}}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \underline{\text{Hom}}_{\mathcal{C}}(X, Y_i)$$

Warning 7.6.1.2. Let \mathcal{C} be an hKan -enriched category, and let $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in \mathcal{C} . If $\{q_i\}_{i \in I}$ exhibits Y as an hKan -enriched product of $\{Y_i\}_{i \in I}$, then it also exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the underlying category \mathcal{C} (where we neglect its hKan -enrichment). Beware that the converse is false in general (see Warning 7.6.1.11).

Definition 7.6.1.3. Let \mathcal{C} be an ∞ -category. We say that a collection of morphisms $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ in \mathcal{C} exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ if the collection of homotopy classes $\{[q_i] : Y \rightarrow Y_i\}_{i \in I}$ exhibits Y as an hKan -enriched product $\{Y_i\}_{i \in I}$ in the homotopy category $\text{h}\mathcal{C}$ (equipped with the hKan -enrichment described in Construction

4.6.8.13). In other words, the collection of morphisms $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection of objects $\{Y_i\}_{i \in I}$ if, for every object $X \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(X, Y_i)$$

is a homotopy equivalence of Kan complexes. Similarly, we say that a collection of morphisms $\{e_i : Y_i \rightarrow Y\}_{i \in I}$ of \mathcal{C} exhibits Y as a coproduct of the collection $\{Y_i\}_{i \in I}$ if, for every object $Z \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, Z) \rightarrow \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(Y_i, Z)$$

is a homotopy equivalence of Kan complexes.

03ED Remark 7.6.1.4. Let $\{f_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in an ∞ -category \mathcal{C} . Then the collection $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the category \mathcal{C} if and only if it exhibits Y as a coproduct of the collection $\{Y_i\}_{i \in I}$ in the opposite ∞ -category $\mathcal{C}^{\mathrm{op}}$.

03EE Remark 7.6.1.5. Let \mathcal{C} be an ∞ -category and let $\{Y_i\}_{i \in I}$ be a collection of objects of \mathcal{C} , which we will identify with a diagram

$$F : I \rightarrow \mathcal{C} \quad F(i) = Y_i$$

indexed by the constant simplicial set associated to I (Remark 1.1.4.3). Suppose we are given another object $Y \in \mathcal{C}$ together with a collection of morphisms $\{q_i : Y \rightarrow Y_i\}_{i \in I}$. The following conditions are equivalent:

- (1) The collection of morphisms $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$, in the sense of Definition 7.6.1.3.
- (2) Let $\underline{Y} : I \rightarrow \mathcal{C}$ denote the constant diagram taking the value Y , so that the collection $\{q_i\}_{i \in I}$ can be identified with a natural transformation $q : \underline{Y} \rightarrow F$. Then q exhibits Y as a limit of the diagram F , in the sense of Definition 7.1.1.1.
- (3) Let $\overline{F} : I^\triangleleft \rightarrow \mathcal{C}$ be the diagram carrying each edge $\{i\}^\triangleleft \subseteq I^\triangleleft$ to the morphism q_i . Then \overline{F} is a limit diagram in \mathcal{C} , in the sense of Definition 7.1.2.4.

The equivalence (1) \Leftrightarrow (2) is immediate from the definitions (see Remark 4.6.1.9) and the equivalence (2) \Leftrightarrow (3) follows from Remark 7.1.2.6.

03EF Remark 7.6.1.6. Let \mathcal{C} be an ordinary category, and let $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in \mathcal{C} . Then $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the category \mathcal{C} (in the sense of classical category theory) if and only if it exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $N_{\bullet}(\mathcal{C})$ (in the sense of Definition 7.6.1.3).

Notation 7.6.1.7. Let \mathcal{C} be an ∞ -category and let $\{Y_i\}_{i \in I}$ be a collection of objects of \mathcal{C} . We will say that an object $Y \in \mathcal{C}$ is a *product* of the collection $\{Y_i\}_{i \in I}$ if there exists a collection of morphisms $\{q_i : Y \rightarrow Y_i\}$ which exhibits Y as a product of $\{Y_i\}_{i \in I}$. If this condition is satisfied, then the object Y is uniquely determined up to isomorphism (see Proposition 7.1.1.12). To emphasize this uniqueness, we will sometimes denote the object Y by $\prod_{i \in I} Y_i$, and refer to it as *the* product of the collection $\{Y_i\}_{i \in I}$. Similarly, we say that Y is a *coproduct* of the collection $\{Y_i\}_{i \in I}$ if there exists a collection of morphisms $\{e_i : Y_i \rightarrow Y\}_{i \in I}$ which exhibits Y as a coproduct of $\{Y_i\}_{i \in I}$. In this case, we sometimes denote the object Y by $\coprod_{i \in I} Y_i$ and refer to it as *the* coproduct of the collection $\{Y_i\}_{i \in I}$.

Example 7.6.1.8 (Initial and Final Objects). Let \mathcal{C} be an ∞ -category. An object $Y \in \mathcal{C}$ is initial (in the sense of Definition 4.6.6.1) if and only if it is the coproduct of the empty collection of objects of \mathcal{C} (see Example 7.1.1.6). Similarly, Y is final if and only if it is a product of the empty collection of objects.

Example 7.6.1.9 (Isomorphisms). Let $f : X \rightarrow Y$ be a morphism in an ∞ -category \mathcal{C} . The following conditions are equivalent:

- (1) The morphism f is an isomorphism.
- (2) The morphism f exhibits X as a product of the one-element collection of objects $\{Y\}$.
- (3) The morphism f exhibits Y as a coproduct of the one-element collection of objects $\{X\}$.

Notation 7.6.1.10. In practice, we will use Definition 7.6.1.3 most often in the case where the set I has exactly two elements, so that the collection $\{Y_i\}_{i \in I}$ can be identified with an ordered pair (Y_0, Y_1) of objects of \mathcal{C} . In this case, we say that morphisms $q_0 : Y \rightarrow Y_0$ and $q_1 : Y \rightarrow Y_1$ exhibit Y as a product of Y_0 with Y_1 if they satisfy the requirement of Definition 7.6.1.3: that is, for every object $X \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{C}}(X, Y_0) \times \mathrm{Hom}_{\mathcal{C}}(X, Y_1)$$

is a homotopy equivalence. If this condition is satisfied, then we will often denote the object Y by $Y_0 \times Y_1$ and refer to it as *the* product of Y_0 with Y_1 . Similarly, we say that a pair of morphisms $e_0 : Y_0 \rightarrow Y$ and $e_1 : Y_1 \rightarrow Y$ exhibit Y as a coproduct of Y_0 with Y_1 if, for every object $Z \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, Z) \rightarrow \mathrm{Hom}_{\mathcal{C}}(Y_0, Z) \times \mathrm{Hom}_{\mathcal{C}}(Y_1, Z)$$

is a homotopy equivalence; in this case, we denote Y by $Y_0 \coprod Y_1$ and refer to it as *the* coproduct of Y_0 with Y_1 .

03EL **Warning 7.6.1.11.** Let \mathcal{C} be an ∞ -category. If $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ is a collection of morphisms of \mathcal{C} which exhibits Y as a product of the collection of objects $\{Y_i\}_{i \in I}$ in the ∞ -category \mathcal{C} , then the collection of homotopy classes $\{[q_i] : Y \rightarrow Y_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ordinary category $h\mathcal{C}$. The converse holds if the collection $\{Y_i\}_{i \in I}$ admits a products in the ∞ -category \mathcal{C} . However, the converse need not hold in general, even in the special case where the set I is empty: see Warning 4.6.6.18.

03EM **Example 7.6.1.12** (Homotopy Products). Let \mathcal{C} be a locally Kan simplicial category, and let $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in \mathcal{C} . By virtue of Theorem 4.6.7.5 (and Proposition 4.6.8.19), the following conditions are equivalent:

- (1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $N_\bullet^{hc}(\mathcal{C})$.
- (2) For every object $X \in \mathcal{C}$, composition with the morphisms q_i determines a homotopy equivalence of Kan complexes

$$\text{Hom}_\mathcal{C}(X, Y)_\bullet \rightarrow \prod_{i \in I} \text{Hom}_\mathcal{C}(X, Y_i)_\bullet.$$

03EN **Example 7.6.1.13** (Products in \mathcal{S}). Let $\{Y_i\}_{i \in I}$ be a collection of Kan complexes and let $Y = \prod_{i \in I} Y_i$ denote their product, formed in the ordinary category of simplicial sets. For each $i \in I$, let $q_i : Y \rightarrow Y_i$ denote the projection map. Applying Example 7.6.1.12 to the simplicial category Kan, we deduce that the morphisms q_i also exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category of spaces $\mathcal{S} = N_\bullet^{hc}(\text{Kan})$. Similarly, if $Y' = \coprod_{i \in I} Y_i$ is the coproduct of the collection $\{Y_i\}_{i \in I}$ in the ordinary category of simplicial sets, then the inclusion maps $Y_i \hookrightarrow Y'$ exhibit Y' as a coproduct of $\{Y_i\}_{i \in I}$ in the ∞ -category \mathcal{S} .

03EP **Example 7.6.1.14** (Products in \mathcal{QC}). Let $\{\mathcal{C}_i\}_{i \in I}$ be a collection of ∞ -categories and let $\mathcal{C} = \prod_{i \in I} \mathcal{C}_i$ denote their product, formed in the ordinary category of simplicial sets. For each $i \in I$, let $q_i : \mathcal{C} \rightarrow \mathcal{C}_i$ denote the projection map. Applying Example 7.6.1.12 to the simplicial category QCat (see Construction 5.6.4.1), we deduce that the morphisms q_i also exhibit \mathcal{C} as a product of the collection $\{\mathcal{C}_i\}_{i \in I}$ in the ∞ -category $\mathcal{QC} = N_\bullet^{hc}(\text{QCat})$ (this is a special case of the diffraction criterion of Theorem 7.4.1.1). Similarly, if $\mathcal{C}' = \coprod_{i \in I} \mathcal{C}_i$ is the coproduct of the collection $\{\mathcal{C}_i\}_{i \in I}$ in the ordinary category of simplicial sets, then the inclusion maps $\mathcal{C}_i \hookrightarrow \mathcal{C}'$ exhibit \mathcal{C}' as a coproduct of $\{\mathcal{C}_i\}_{i \in I}$ in the ∞ -category QCat (this is a special case of the refraction criterion of Theorem 7.4.3.6).

03EQ **Example 7.6.1.15** (Products in a Duskin Nerve). Let \mathcal{C} be a $(2, 1)$ -category and let $\{q_i : Y \rightarrow Y_i\}$ be a collection of 1-morphisms in \mathcal{C} . Then the following conditions are equivalent:

- (1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $N_\bullet^D(\mathcal{C})$.
- (2) For every object $X \in \mathcal{C}$, horizontal composition with the 1-morphisms q_i induces an equivalence of categories

$$\underline{\text{Hom}}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \underline{\text{Hom}}_{\mathcal{C}}(X, Y_i).$$

This follows from the explicit description of pinched morphism spaces in $N_\bullet^D(\mathcal{C})$ supplied by Example 4.6.5.12.

Example 7.6.1.16 (Products in a Differential Graded Nerve). Let \mathcal{C} be a differential graded category and let $\{q_i : Y \rightarrow Y_i\}$ be a collection of morphisms in the underlying category of \mathcal{C} (that is, each q_i is a 0-cycle of the chain complex $\text{Hom}_{\mathcal{C}}(Y, Y_i)_*$). Using Example 4.6.5.14 (together with Exercise 3.2.2.18), we see that the following conditions are equivalent:

- (1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $N_\bullet^{\text{dg}}(\mathcal{C})$.
- (2) For every object $X \in \mathcal{C}$, the map of chain complexes

$$\text{Hom}_{\mathcal{C}}(X, Y)_* \rightarrow \prod_{i \in I} \text{Hom}_{\mathcal{C}}(X, Y_i)_*$$

induces an isomorphism on homology in degrees ≥ 0 .

Proposition 7.6.1.17 (Rewriting Limits as Products). *Let \mathcal{C} be an ∞ -category, and let $\{f_i : K_i \rightarrow \mathcal{C}\}_{i \in I}$ be a collection of diagrams, each of which admits a limit $X_i = \varprojlim(f_i)$. Set $K = \coprod_{i \in I} K_i$, so that the collection $\{f_i\}_{i \in I}$ determines a diagram $f : K \rightarrow \mathcal{C}$. Then an object of \mathcal{C} is a limit of the diagram f if it is a product of the collection of objects $\{X_i\}_{i \in I}$.*

Proof. This is a special case of (the dual of) Proposition 7.5.8.12. □

Remark 7.6.1.18. In the situation of Proposition 7.6.1.17, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor which preserves the limits of each of the diagrams f_i . Suppose that the collection $\{X_i\}_{i \in I}$ admits a product in \mathcal{C} . Then the product of $\{X_i\}_{i \in I}$ is preserved by the functor F if and only if the limit of f is preserved by the functor F .

Corollary 7.6.1.19. *Let $\{K_i\}_{i \in I}$ be a collection of simplicial sets having coproduct $K = \coprod_{i \in I} K_i$, and let \mathcal{C} be an ∞ -category. Suppose that \mathcal{C} admits I -indexed products and K_i -indexed limits for each $i \in I$. Then \mathcal{C} admits K -indexed limits. Moreover, if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor which preserves I -indexed products and K_i -indexed colimits for each $i \in I$, then F also preserves K -indexed limits.*

03EV **Corollary 7.6.1.20.** *Let \mathcal{C} be an ∞ -category. Then \mathcal{C} admits finite products if and only if it satisfies the following pair of conditions:*

- (1) *The ∞ -category \mathcal{C} has a final object $\mathbf{1}$.*
- (2) *The ∞ -category \mathcal{C} admits pairwise products. That is, every pair of objects $X, Y \in \mathcal{C}$ have a product $X \times Y$ in \mathcal{C} .*

Proof. The necessity of conditions (1) and (2) is clear (see Example 7.6.1.8). Conversely, suppose that (1) and (2) are satisfied, and let I be a finite set. We wish to show that \mathcal{C} admits I -indexed limits. We proceed by induction on the cardinality of I . If I is empty, then the desired result follows from assumption (1). If I is a singleton, then the desired result is obvious (see Example 7.6.1.9). Otherwise, we can write I as a disjoint union of proper subsets $I_-, I_+ \subset I$. Our inductive hypothesis then guarantees that \mathcal{C} admits I_- -indexed limits and I_+ -indexed limits. Combining assumption (2) with Corollary 7.6.1.19, we deduce that \mathcal{C} admits limits indexed by $I = I_- \coprod I_+$. \square

03EW **Remark 7.6.1.21.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{C} admits finite products. Then F preserves finite products if and only if it preserves final objects and pairwise products.

7.6.2 Powers and Tensors

03EX We now study limits and colimits which are indexed by *constant* diagrams of simplicial sets. Like products and coproducts, these can be characterized by universal properties in the (enriched) homotopy category.

03EY **Definition 7.6.2.1.** Let \mathcal{C} be an ∞ -category containing a pair of objects X and Y , and let $e : K \rightarrow \text{Hom}_{\mathcal{C}}(X, Y)$ be a morphism of simplicial sets. We will say that e exhibits X as a power of Y by K if, for every object $W \in \mathcal{C}$, the composition law $\circ : \text{Hom}_{\mathcal{C}}(X, Y) \times \text{Hom}_{\mathcal{C}}(W, X) \rightarrow \text{Hom}_{\mathcal{C}}(W, Y)$ of Construction 4.6.8.9 induces a homotopy equivalence of Kan complexes $\text{Hom}_{\mathcal{C}}(W, X) \rightarrow \text{Fun}(K, \text{Hom}_{\mathcal{C}}(W, Y))$.

We will say that e exhibits Y as a tensor product of X by K if, for every object $Z \in \mathcal{C}$, the composition law $\circ : \text{Hom}_{\mathcal{C}}(Y, Z) \times \text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{C}}(X, Z)$ induces a homotopy equivalence of Kan complexes $\text{Hom}_{\mathcal{C}}(Y, Z) \rightarrow \text{Fun}(K, \text{Hom}_{\mathcal{C}}(X, Z))$.

03EZ **Warning 7.6.2.2.** In the situation of Definition 7.6.2.1, the composition law

$$\circ : \text{Hom}_{\mathcal{C}}(Y, Z) \times \text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{C}}(X, Z)$$

is only well-defined up to homotopy. However, the requirement that it induces a homotopy equivalence $\text{Hom}_{\mathcal{C}}(Y, Z) \rightarrow \text{Fun}(K, \text{Hom}_{\mathcal{C}}(X, Z))$ depends only on its homotopy class.

Remark 7.6.2.3. In the situation of Definition 7.6.2.1, the condition that $e : K \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ exhibits X as a power of Y by K (or Y as a tensor product of X by K) depends only on the homotopy class $[e] \in \pi_0(\text{Fun}(K, \underline{\text{Hom}}_{\mathcal{C}}(X, Y)))$.

Remark 7.6.2.4 (Duality). In the situation of Definition 7.6.2.1, the morphism $e : K \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ exhibits X as a power of Y by K in the ∞ -category \mathcal{C} if and only if the morphism

$$e^{\text{op}} : K^{\text{op}} \rightarrow \text{Hom}_{\mathcal{C}}(X, Y)^{\text{op}} \simeq \text{Hom}_{\mathcal{C}^{\text{op}}}(Y, X)$$

exhibits X as a tensor product of Y by K^{op} in the opposite ∞ -category \mathcal{C}^{op} .

Notation 7.6.2.5. Let \mathcal{C} be an ∞ -category, let Y be an object of \mathcal{C} , and let K be a simplicial set. Suppose that there exists an object $X \in \mathcal{C}$ and a morphism $e : K \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ which exhibits X as a power of Y by K . In this case, the object X is uniquely determined up to isomorphism. To emphasize this uniqueness, we will sometimes denote the object X by Y^K .

Similarly, if there exists an object $Z \in \mathcal{C}$ and a morphism $e : K \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(Y, Z)$ which exhibits Z as a tensor product of Y by K , then Z is uniquely determined up to isomorphism. We will sometimes emphasize this dependence by denoting the object Z by $K \otimes Y$.

Remark 7.6.2.6 (Powers as Limits). Let \mathcal{C} be an ∞ -category containing objects X and Y . Then a morphism of simplicial sets $e : K \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ can be identified with a natural transformation $\alpha : \underline{X} \rightarrow \underline{Y}$, where $\underline{X}, \underline{Y} : K \rightarrow \mathcal{C}$ denote the constant diagrams taking the values X and Y , respectively. In this case:

- The natural transformation α exhibits the object X as a limit of the diagram \underline{Y} (in the sense of Definition 7.1.1.1) if and only if e exhibits X as a power of Y by K (in the sense of Definition 7.6.2.1).
- The natural transformation α exhibits the object Y as a colimit of the diagram \underline{X} (in the sense of Definition 7.1.1.1) if and only if e exhibits Y as a tensor product of X by K (in the sense of Definition 7.6.2.1).

Example 7.6.2.7. Let \mathcal{C} be an ∞ -category containing objects X and Y , and suppose we are given a collection of morphisms $\{f_j : X \rightarrow Y\}_{j \in J}$ indexed by a set J . If we abuse notation by identifying J with the corresponding discrete simplicial set, then the collection $\{f_j\}_{j \in J}$ can be identified with a map $e : J \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. In this case:

- The morphism e exhibits X as a power of Y by J (in the sense of Definition 7.6.2.1) if and only if the collection $\{f_j\}_{j \in J}$ exhibits X as a product of the collection $\{Y\}_{j \in J}$ (in the sense of Definition 7.6.1.3). Stated more informally, we have a canonical isomorphism $Y^J \simeq \prod_{j \in J} Y$ (provided that either side is defined).

- The morphism e exhibits Y as a tensor product of X by J (in the sense of Definition 7.6.2.1) if and only if the collection $\{f_j\}_{j \in J}$ exhibits Y as a coproduct of the collection $\{X\}_{j \in J}$ (in the sense of Definition 7.6.1.3). Stated more informally, we have a canonical isomorphism $J \otimes X \simeq \coprod_{j \in J} X$ (provided that either side is defined).

03F5 **Example 7.6.2.8.** Let \mathcal{C} be an ∞ -category containing objects X and Y . Then the unique morphism $e : \emptyset \rightarrow \text{Hom}_{\mathcal{C}}(X, Y)$ exhibits X as a power of Y by the empty simplicial set if and only if X is a final object of \mathcal{C} . Similarly, e exhibits Y as a tensor product of X by the empty simplicial set if and only if Y is an initial object of \mathcal{C} .

03F6 **Proposition 7.6.2.9.** Let \mathcal{C} be a locally Kan simplicial category, let X and Y be objects of \mathcal{C} , and let $e : K \rightarrow \text{Hom}_{\mathcal{C}}(X, Y)_{\bullet}$ be a morphism of simplicial sets. Let $N_{\bullet}^{\text{hc}}(\mathcal{C})$ denote the homotopy coherent nerve of \mathcal{C} , and let $\theta_{X,Y} : \text{Hom}_{\mathcal{C}}(X, Y)_{\bullet} \rightarrow \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(X, Y)$ denote the comparison map of Remark 4.6.7.6. Then:

- (1) The morphism $\theta_{X,Y} \circ e$ exhibits X as a power of Y by K in the ∞ -category $N_{\bullet}^{\text{hc}}(\mathcal{C})$ if and only if, for every object $W \in \mathcal{C}$, composition with e induces a homotopy equivalence of Kan complexes

$$c_W : \text{Hom}_{\mathcal{C}}(W, X)_{\bullet} \rightarrow \text{Fun}(K, \text{Hom}_{\mathcal{C}}(W, Y)_{\bullet}).$$

- (2) The morphism $\theta_{X,Y} \circ e$ exhibits Y as a tensor product of X by K in the ∞ -category $N_{\bullet}^{\text{hc}}(\mathcal{C})$ if and only if, for every object $Z \in \mathcal{C}$, precomposition with e induces a homotopy equivalence of Kan complexes

$$\text{Hom}_{\mathcal{C}}(Y, Z)_{\bullet} \rightarrow \text{Fun}(K, \text{Hom}_{\mathcal{C}}(X, Z)_{\bullet}).$$

Proof. We will prove (1); the proof of (2) is similar. Fix an object $W \in \mathcal{C}$, so that the composition law

$$\circ : \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(X, Y) \times \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(W, X) \rightarrow \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(W, Y)$$

of Construction 4.6.8.9 determines a morphism of Kan complexes $c'_W : \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(W, X) \rightarrow \text{Fun}(K, \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(W, Y)_{\bullet})$ (which is well-defined up to homotopy). To prove Proposition 7.6.2.9, it will suffice to show that c'_W is a homotopy equivalence if and only if c_W is a homotopy equivalence. Proposition 4.6.8.19 guarantees that the diagram

$$\begin{array}{ccc} \text{Hom}_{\mathcal{C}}(W, X)_{\bullet} & \xrightarrow{c_W} & \text{Fun}(K, \text{Hom}_{\mathcal{C}}(W, Y)_{\bullet}) \\ \downarrow \theta_{W,X} & & \downarrow \theta_{W,Y} \circ \\ \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(W, X) & \xrightarrow{c'_W} & \text{Fun}(K, \text{Hom}_{N_{\bullet}^{\text{hc}}(\mathcal{C})}(W, Y)_{\bullet}) \end{array}$$

commutes up to homotopy. We conclude by observing that the horizontal maps are homotopy equivalences, by virtue of Theorem 4.6.7.5 (and Remark 4.6.7.6). \square

Example 7.6.2.10. Let X and Y be essentially small Kan complexes, let $e_0 : K \rightarrow \text{Fun}(X, Y)$ be a morphism of simplicial sets, and let $e : K \rightarrow \text{Hom}_{\mathcal{S}}(X, Y)$ denote the composition of e_0 with the homotopy equivalence $\text{Fun}(X, Y) \rightarrow \text{Hom}_{\mathcal{S}}(X, Y)$ of Remark 5.6.1.5. Then:

- The morphism e exhibits X as a power of Y by K in the ∞ -category \mathcal{S} if and only if the induced map $X \rightarrow \text{Fun}(K, Y)$ is a homotopy equivalence of Kan complexes.
- The morphism e exhibits Y as a tensor product of X by K in the ∞ -category \mathcal{S} if and only if the induced map $K \times X \rightarrow Y$ is a weak homotopy equivalence of simplicial sets.

Example 7.6.2.11. Let Y be an essentially small Kan complex. Suppose we are given a morphism of simplicial sets $f : K \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, Y)$, which we identify with a morphism $\tilde{f} : \underline{\Delta^0}_K \rightarrow \underline{Y}_K$ in the ∞ -category $\text{Fun}(K, \mathcal{S})$. Then f is a weak homotopy equivalence if and only if \tilde{f} exhibits Y as a tensor product of Δ^0 by K (in the ∞ -category \mathcal{S}). To prove this, we are free to modify the morphism f by a homotopy (see Remark 7.6.2.3). We may therefore assume without loss of generality that f factors through the homotopy equivalence $e : \text{Fun}(\Delta^0, Y) \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, Y)$ of Remark 5.6.1.5, in which case the desired result follows from the criterion of Example 7.6.2.10 (applied in the case $X = \Delta^0$). Taking $K = Y$ and $f = e$, we see that every Kan complex Y can be viewed as a colimit of the constant diagram $Y \rightarrow \{\Delta^0\} \hookrightarrow \mathcal{S}$ (see Remark 7.6.2.6).

Remark 7.6.2.12 (Cofinality and Kan Extensions). Let \mathcal{C} be an ∞ -category and let $\delta : K \rightarrow \mathcal{C}$ be a morphism of simplicial sets. The following conditions are equivalent:

- (1) The morphism δ is left cofinal.
- (2) The identity transformation $\text{id} : \underline{\Delta^0}_K \rightarrow \underline{\Delta^0}_{\mathcal{C}} \circ \delta$ exhibits the constant functor $\underline{\Delta^0}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{S}$ as a left Kan extension of the constant diagram $\underline{\Delta^0}_K : K \rightarrow \mathcal{S}$ along δ .

By virtue of Theorem 7.2.3.1 and Example 7.6.2.11, both conditions are equivalent to the requirement that, for every object $C \in \mathcal{C}$, the simplicial set $K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C}$ is weakly contractible.

Example 7.6.2.13. Let \mathcal{C} and \mathcal{D} be ∞ -categories, let $e_0 : K \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$ be a morphism of Kan complexes, and let e denote the composition of e_0 with the homotopy equivalence $\text{Fun}(\mathcal{C}, \mathcal{D})^{\simeq} \rightarrow \text{Hom}_{\mathcal{QC}}(\mathcal{C}, \mathcal{D})$ of Remark 5.6.4.5. Combining Propositions 7.6.2.9 and 4.4.3.20, we obtain the following:

- The morphism e exhibits \mathcal{C} as a power of \mathcal{D} by K in the ∞ -category \mathcal{QC} if and only if the induced map $\mathcal{C} \rightarrow \text{Fun}(K, \mathcal{D})$ is an equivalence of ∞ -categories.

- The morphism e exhibits \mathcal{C} as a tensor product of \mathcal{D} by K in the ∞ -category \mathcal{QC} if and only if the induced map $K \times \mathcal{C} \rightarrow \mathcal{D}$ is an equivalence of ∞ -categories.

03FA **Warning 7.6.2.14.** In the statement of Example 7.6.2.13, the assumption that K is a Kan complex cannot be omitted.

Examples 7.6.2.10 and 7.6.2.13 show that the ∞ -categories \mathcal{S} and \mathcal{QC} admit powers and tensor products by any small simplicial set K . Beware that it is very rare for a *small* ∞ -category to have the same property:

048B **Proposition 7.6.2.15.** *Let S be an infinite set of cardinality κ and let \mathcal{C} be an ∞ -category which is locally κ^+ -small. The following conditions are equivalent:*

- (1) *The ∞ -category \mathcal{C} is equivalent to the nerve of a partially ordered set.*
- (2) *For every nonempty simplicial set K and every object $X \in \mathcal{C}$, the constant map*

$$K \rightarrow \{\text{id}_X\} \hookrightarrow \text{Hom}_{\mathcal{C}}(X, X)$$

exhibits X as a power of itself by K .

- (3) *Every object $X \in \mathcal{C}$ admits a power by S .*

Proof. The implications $(1) \Rightarrow (2) \Rightarrow (3)$ are immediate from the definitions. We will show that (3) implies (1) . Assume that condition (3) is satisfied and fix a pair of objects $X, Y \in \mathcal{C}$; we wish to show that the morphism space $M = \text{Hom}_{\mathcal{C}}(Y, X)$ is either empty or contractible. Assume otherwise: then there exists a morphism $f : Y \rightarrow X$ in \mathcal{C} and an integer $n \geq 0$ such that the homotopy set $\pi_n(M, f)$ has at least two elements. Using assumption (3) , we can choose an object $X' \in \mathcal{C}$ and a collection of morphisms $\{g_s : X' \rightarrow X\}$ which exhibit X' as a power of X by S . Choose a morphism $f' : Y \rightarrow X$ such that $g_s \circ f'$ is homotopic to f for each $s \in S$. Then $\pi_n(M', f')$ can be identified with the product $\prod_{s \in S} \pi_n(M, f)$. This set has cardinality larger than κ (Proposition 5.4.2.8), contradicting our assumption that \mathcal{C} is locally κ^+ -small. \square

We can use Example 7.6.2.10 to give an alternative proof of the univerality of the left fibration $\mathcal{S}_* \rightarrow \mathcal{S}$ (see Corollary 5.7.0.6).

03LT **Proposition 7.6.2.16** (Covariant Transport as a Kan Extension). *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small left fibration of ∞ -categories, let $\underline{\Delta}_{\mathcal{E}}^0$ denote the constant functor $\mathcal{E} \rightarrow \mathcal{S}$ taking the value Δ^0 , and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be any functor. Suppose we are given a natural transformation $\beta : \underline{\Delta}_{\mathcal{E}}^0 \rightarrow \mathcal{F} \circ U$. The following conditions are equivalent:*

- (1) *The natural transformation β exhibits \mathcal{F} as a left Kan extension of $\underline{\Delta}_{\mathcal{E}}^0$ along U (in the sense of Variant 7.3.1.5).*

(2) *The commutative diagram*

$$\begin{array}{ccc}
 \mathcal{E} & \xrightarrow{\beta} & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \\
 \downarrow U & & \downarrow \\
 \mathcal{C} & \xrightarrow{\mathcal{F}} & \mathcal{S}
 \end{array}
 \quad \text{03LU} \quad (7.50)$$

is a categorical pullback square.

Proof. Fix an object $C \in \mathcal{C}$ and let \mathcal{E}_C denote the fiber $\{C\} \times_{\mathcal{C}} \mathcal{E}$, so that the restriction of β to \mathcal{E}_C can be identified with a morphism of Kan complexes $e_C : \mathcal{E}_C \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{F}(C))$. By virtue of Proposition 7.3.4.1 and Corollary 5.1.7.15, it will suffice to show that the following conditions are equivalent:

- (1_C) The morphism e_C exhibits $\mathcal{F}(C)$ as a tensor product of Δ^0 by \mathcal{E}_C (as an object of the ∞ -category \mathcal{S}).
- (2_C) The morphism e_C is a homotopy equivalence.

This is a special case of Example 7.6.2.11. □

Corollary 7.6.2.17. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small left fibration of ∞ -categories. 03LV Then a functor $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ is a covariant transport representation for U (in the sense of Definition 5.7.5.1) if and only if it is a left Kan extension of the constant functor $\underline{\Delta^0}_{\mathcal{E}}$ along U .*

Proof. Combine Proposition 7.6.2.16 with the equivalence $\mathcal{S}_* \hookrightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}$ of Theorem 4.6.4.17. □

Variant 7.6.2.18. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of ∞ -categories, and suppose that the fibers of U are essentially κ -small for some uncountable cardinal κ . Then, in the statements of Proposition 7.6.2.16 and Corollary 7.6.2.17, we can replace \mathcal{S} by the ∞ -category $\mathcal{S}^{<\kappa}$ of κ -small spaces (see Variant 5.6.4.12). 03V1

We now consider a variant of Proposition 7.6.2.9. Suppose we are given a differential graded category \mathcal{C} containing objects X and Y . Let

$$\rho_{X,Y} : K(\text{Hom}_{\mathcal{C}}(X, Y)_*) \hookrightarrow \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}(X, Y)$$

denote the composition of the isomorphism $K(\text{Hom}_{\mathcal{C}}(X, Y)_*) \simeq \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}^L(X, Y)$ of Example 4.6.5.14 with the pinch inclusion morphism $\text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}^L(X, Y) \hookrightarrow \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}^L(X, Y)$ of Construction 4.6.5.6.

03FB Proposition 7.6.2.19. *Let \mathcal{C} be a differential graded category, let X and Y be objects of \mathcal{C} , and suppose we are given a morphism of simplicial sets $e_0 : S \rightarrow K(\text{Hom}_{\mathcal{C}}(X, Y)_*)$, which we identify with a morphism of chain complexes $f : N_*(S; \mathbf{Z}) \rightarrow \text{Hom}_{\mathcal{C}}(X, Y)_*$. Let $e : S \rightarrow \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}(X, Y)$ denote the composition of e_0 with the morphism $\rho_{X,Y}$. The following conditions are equivalent:*

- (1) *The morphism e exhibits X as a tensor product of Y by S in the ∞ -category $N_{\bullet}^{\text{dg}}(\mathcal{C})$.*
- (2) *Let Z be an object of \mathcal{C} , so that f induces a morphism of chain complexes*

$$\theta : \text{Hom}_{\mathcal{C}}(Y, Z)_* \rightarrow \text{Hom}_{\text{Ch}(\mathbf{Z})}(N_*(S; \mathbf{Z}), \text{Hom}_{\mathcal{C}}(X, Z)_*)_*$$

Then θ is an isomorphism on homology in degrees ≥ 0 .

Proof of Proposition 7.6.2.19. Fix an object $Z \in \mathcal{C}$. Using Proposition 4.6.8.21, we see that the diagram of Kan complexes

$$\begin{array}{ccc}
 K(\text{Hom}_{\mathcal{C}}(Y, Z)_*) & \xrightarrow{K(\theta)} & K(\text{Hom}_{\text{Ch}(\mathbf{Z})}(N_*(S; \mathbf{Z}), \text{Hom}_{\mathcal{C}}(X, Z)_*)_*) \\
 \downarrow \rho_{Y,Z} & & \downarrow \psi \\
 & & \text{Fun}(S, K(\text{Hom}_{\mathcal{C}}(X, Z)_*)) \\
 & & \downarrow \rho_{X,Z} \circ \\
 \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}(Y, Z) & \longrightarrow & \text{Fun}(S, \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}(X, Z))
 \end{array}$$

commutes up to homotopy, where ψ is the homotopy equivalence of Example 3.1.6.11 and the bottom horizontal map is given by combining e with the composition law on the ∞ -category $N_{\bullet}^{\text{dg}}(\mathcal{C})$. Note that condition (1) is equivalent to the requirement that the bottom horizontal map is a homotopy equivalence (for each object $Z \in \mathcal{C}$). Since the map $\rho_{Y,Z}$ and $\rho_{X,Z}$ are also homotopy equivalences (Proposition 4.6.5.9), this is equivalent to the requirement that $K(\theta)$ is a homotopy equivalence (for each object $Z \in \mathcal{C}$). The equivalence of (1) and (2) now follows from the criterion of Corollary 3.2.7.7. \square

03FC Example 7.6.2.20 (Homology as a Colimit). Let $\mathcal{C} = \text{Ch}(\mathbf{Z})$ denote the category of chain complexes of abelian groups, which we regard as a differential graded category (see Example 2.5.2.5). Let A be an abelian group, and let us abuse notation by identifying A with its image in \mathcal{C} (by regarding it as a chain complex concentrated in degree zero). For every

simplicial set S , let $N_*(S; A)$ denote the normalized chain complex of S with coefficients in A , given by the tensor product $N_*(S; \mathbf{Z}) \boxtimes A$. Then the tautological map

$$f : N_*(S; \mathbf{Z}) \rightarrow \text{Hom}_{\text{Ch}(\mathbf{Z})}(A, N_*(S; A))_*$$

satisfies condition (2) of Proposition 7.6.2.19: in fact, for every object $M_* \in \mathcal{C}$, precomposition with f induces an *isomorphism* of chain complexes

$$\text{Hom}_{\mathcal{C}}(N_*(S; A), M_*)_* \rightarrow \text{Hom}_{\mathcal{C}}(N_*(S; \mathbf{Z}), \text{Hom}_{\mathcal{C}}(A, M_*)_*)_*.$$

It follows that the induced map $S \rightarrow \text{Hom}_{N_{\bullet}^{\text{dg}}(\mathcal{C})}(A, N_*(S; A))$ exhibits $N_*(S; A)$ as a tensor product of A by S in the ∞ -category $N_{\bullet}^{\text{dg}}(\mathcal{C})$. In particular, the chain complex $N_*(S; A)$ can be viewed as a colimit of the constant diagram $S \rightarrow \{A\} \hookrightarrow N_{\bullet}^{\text{dg}}(\text{Ch}(\mathbf{Z}))$.

Variant 7.6.2.21 (Cohomology as a Limit). Let A be an abelian group, let S be a simplicial 03FD set, and let

$$N^*(S; A) = \text{Hom}_{\text{Ch}(\mathbf{Z})}(N_*(S; \mathbf{Z}), A)$$

denote the normalized *cochain* complex of S with coefficients in A . Applying Proposition 7.6.2.19 to the differential graded category $\text{Ch}(\mathbf{Z})^{\text{op}}$ (and using Remark 7.6.2.4), we see that the tautological chain map $N_*(S; \mathbf{Z}) \rightarrow \text{Hom}_{\text{Ch}(\mathbf{Z})}(N^*(S; A), A)_*$ induces a morphism of simplicial sets

$$e : S \rightarrow \text{Hom}_{N_{\bullet}^{\text{dg}}(\text{Ch}(\mathbf{Z}))}(N^*(S; A), A)$$

which exhibits $N^*(S; A)$ as a power of A by S in the ∞ -category $N_{\bullet}^{\text{dg}}(\text{Ch}(\mathbf{Z}))$. In particular, $N^*(S; A)$ can be viewed as a limit of the constant diagram $S \rightarrow \{A\} \hookrightarrow N_{\bullet}^{\text{dg}}(\text{Ch}(\mathbf{Z}))$.

7.6.3 Pullbacks and Pushouts

Let \mathcal{C} be an ∞ -category. Recall that a *commutative square* in \mathcal{C} is a morphism of 03FE simplicial sets $\Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ which we represent informally by a diagram

$$\begin{array}{ccc} X' & \longrightarrow & Y' \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

(see Example 1.4.2.15). Note that the simplicial set $\Delta^1 \times \Delta^1 \simeq N_{\bullet}([1] \times [1])$ can be regarded both as a left cone (on the nerve of the partially ordered set $[1] \times [1] \setminus \{(0, 0)\}$) and as a right cone (on the nerve of the partially ordered set $[1] \times [1] \setminus \{(1, 1)\}$).

03FF **Definition 7.6.3.1.** Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square. We say that σ is a *pullback square* if it is a limit diagram in \mathcal{C} (see Definition 7.1.2.4), and that σ is a *pushout square* if it is a colimit diagram in \mathcal{C} .

03FG **Example 7.6.3.2.** Let \mathcal{C} be an ordinary category. Then diagram $\sigma : [1] \times [1] \rightarrow \mathcal{C}$ is a pullback square in \mathcal{C} (in the sense of classical category theory) if and only if the induced map

$$N_\bullet(\sigma) : \Delta^1 \times \Delta^1 \rightarrow N_\bullet(\mathcal{C})$$

is a pullback square in the ∞ -category $N_\bullet(\mathcal{C})$ (in the sense of Definition 7.6.3.1); this follows from Example 7.1.1.4 and Remark 7.1.2.6. Similarly, σ is a pushout square in \mathcal{C} if and only if $N_\bullet(\sigma)$ is a pushout square in the ∞ -category $N_\bullet(\mathcal{C})$.

03FH **Warning 7.6.3.3.** Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a morphism, which we depict as a diagram

$$\begin{array}{ccc} X_{01} & \xrightarrow{g_0} & X_0 \\ \downarrow g_1 & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

Beware that, if σ is a pullback square in the ∞ -category \mathcal{C} , then the associated diagram

$$\begin{array}{ccc} X_{01} & \xrightarrow{[g_0]} & X_0 \\ \downarrow [g_1] & & \downarrow [f_0] \\ X_1 & \xrightarrow{[f_1]} & X \end{array}$$

need not be a pullback square in the homotopy category $h\mathcal{C}$ (see Example 7.6.3.4 and Exercise 7.6.3.5). If Y is an object of \mathcal{C} , then the map of sets

$$\text{Hom}_{h\mathcal{C}}(Y, X_{01}) \xrightarrow{([g_0], [g_1]) \circ} \text{Hom}_{h\mathcal{C}}(Y, X_0) \times_{\text{Hom}_{h\mathcal{C}}(Y, X)} \text{Hom}_{h\mathcal{C}}(Y, X_1)$$

is surjective, but need not be injective. Given a commutative diagram

$$\begin{array}{ccc} Y & \xrightarrow{[g_0]} & X_0 \\ \downarrow [g_1] & & \downarrow [f_0] \\ X_1 & \xrightarrow{[f_1]} & X \end{array} \tag{7.51}$$

03FJ

in the homotopy category $\text{h}\mathcal{C}$, we can always find a morphism $g_{01} : Y \rightarrow X_{01}$ satisfying $g_{01} : Y \rightarrow X_{01}$ satisfying $[g_0] = [f'_0] \circ [g_{01}]$ and $[g_1] = [f'_1] \circ [g_{01}]$. However, the homotopy class $[g_{01}]$ is not uniquely determined: roughly speaking, to construct g_{01} , we need to lift (7.51) to a commutative diagram in the ∞ -category \mathcal{C} . Such a lift always exists (Exercise 1.4.2.10), but is not unique (even up to homotopy).

Example 7.6.3.4. Let $q : X \rightarrow S$ be a Kan fibration between Kan complexes, let $s \in S$ be 03FK a vertex, and let X_s denote the fiber $\{s\} \times_S X$. Then the commutative diagram of simplicial sets

$$\begin{array}{ccc} X_s & \longrightarrow & X \\ \downarrow & & \downarrow q \\ \{s\} & \longrightarrow & S \end{array} \quad \begin{matrix} 03FL \\ (7.52) \end{matrix}$$

is a homotopy pullback square (Example 3.4.1.3), and therefore induces a pullback square in the ∞ -category $\mathcal{S} = N_\bullet^{\text{hc}}(\text{Kan})$ (see Example 7.6.4.2). However, if X is contractible and X_s is not, then (7.52) is not a pullback square in the homotopy category hKan .

Exercise 7.6.3.5. Let G be a group and let $H \subseteq G$ be a commutative normal subgroup, so 03FM that we have a commutative diagram of Kan complexes

$$\begin{array}{ccc} B_\bullet H & \longrightarrow & B_\bullet G \\ \downarrow & & \downarrow \\ \Delta^0 & \longrightarrow & B_\bullet(G/H) \end{array} \quad \begin{matrix} 03FN \\ (7.53) \end{matrix}$$

- Show that (7.53) is a pullback diagram in the ordinary category of Kan complexes, and that it determines a pullback diagram in the ∞ -category $\mathcal{S} = N_\bullet^{\text{hc}}(\text{Kan})$ (see Example 7.6.4.2).
- Show that, if H is contained in the center of G , then the diagram (7.53) is also pullback square in the homotopy category hKan .
- Show that, if H is not contained in the center of G , then the diagram $B_\bullet G \rightarrow B_\bullet(G/H) \leftarrow \Delta^0$ does not have a limit in the homotopy category hKan . In particular, the diagram (7.53) is not a pullback square in hKan .

Variant 7.6.3.6. Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. We say that a diagram 048C $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ is a U -pullback square if it is a U -limit diagram in \mathcal{C} (Definition 7.1.5.1). We say that σ is a U -pushout square if it is a U -colimit diagram in the ∞ -category \mathcal{C} .

048D **Remark 7.6.3.7.** Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square in \mathcal{C} . Then σ is a pullback square if and only if it is U -pullback square, where $U : \mathcal{C} \rightarrow \Delta^0$ is the projection map (see Example 7.1.5.3).

03FP **Remark 7.6.3.8** (Symmetry). Let \mathcal{C} be an ∞ -category, let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square in \mathcal{C} , and let $\sigma' : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ denote the commutative square which is obtained from σ by precomposing with the automorphism of $\Delta^1 \times \Delta^1$ given by permuting the factors. Then σ is a pullback square if and only if σ' is a pullback square, and σ is a pushout square if and only if σ' is a pushout square.

More generally, if $U : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories, then σ is a U -pullback square if and only if σ' is a U -pullback square, and σ is a U -pushout square if and only if σ' is a U -pushout square.

03FQ **Remark 7.6.3.9.** Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative diagram in \mathcal{C} . Then σ is a pushout diagram in \mathcal{C} if and only if the opposite diagram $\sigma^{\text{op}} : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}^{\text{op}}$ is a pullback diagram in the ∞ -category \mathcal{C}^{op} ; here we implicitly identify the simplicial set $\Delta^1 \times \Delta^1$ with its opposite (beware that there are two possible identifications we could choose, but the choice does not matter by virtue of Remark 7.6.3.8).

More generally, if $U : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories, then σ is a U -pushout diagram if and only if σ^{op} is a U^{op} -pullback diagram.

03FR **Remark 7.6.3.10.** Let \mathcal{C} be an ∞ -category and let $\sigma, \sigma' : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be square diagrams which are isomorphic (when viewed as objects of the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$). Then σ is a pullback square if and only if σ' is a pullback square, and a pushout square if and only if σ' is a pushout square.

More generally, if $U : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories, then σ is a U -pullback square if and only if σ' is a U -pullback square, and σ is a U -pushout square if and only if σ' is a U -pushout square (see Proposition 7.1.5.13).

03FS **Notation 7.6.3.11** (Fiber Products). Let \mathcal{C} be an ∞ -category, and suppose we are given a pair of morphisms $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ of \mathcal{C} having the same target. It follows from Proposition 7.1.1.12 that if there exists a pullback diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in \mathcal{C} , then the object X_{01} is determined up to isomorphism by f_0 and f_1 . To emphasize this, we will often denote the object X_{01} by $X_0 \times_X X_1$ and refer to it as the *fiber product* of X_0

with X_1 over X . Similarly, if there exists a pushout diagram

$$\begin{array}{ccc} Y & \xrightarrow{g_0} & Y_0 \\ \downarrow g_1 & & \downarrow \\ Y_1 & \longrightarrow & Y_{01} \end{array}$$

in \mathcal{C} , then the object Y_{01} is determined up to isomorphism by g_0 and g_1 . To emphasize this, we often denote the object Y_{01} by $Y_0 \coprod_Y Y_1$ and refer to it as the *pushout of Y_0 with Y_1 along Y* .

Definition 7.6.3.12. Let \mathcal{C} be an ∞ -category. We will say that \mathcal{C} *admits pullbacks* if, for every pair of morphisms $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ having the same target, there exists a pullback diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

We say that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ *preserves pullbacks* if, for every pullback square $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ in the ∞ -category \mathcal{C} , the composition $(F \circ \sigma) : \Delta^1 \times \Delta^1 \rightarrow \mathcal{D}$ is a pullback square in the ∞ -category \mathcal{D} .

We say that \mathcal{C} *admits pushouts* if, for every pair of morphisms $g_0 : Y \rightarrow Y_0$ and $g_1 : Y \rightarrow Y_1$ having the same source, there exists a pushout diagram

$$\begin{array}{ccc} Y & \xrightarrow{g_0} & Y_0 \\ \downarrow g_1 & & \downarrow \\ Y_1 & \longrightarrow & Y_{01}. \end{array}$$

We say that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ *preserves pushbacks* if, for every pushout square $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ in the ∞ -category \mathcal{C} , the composition $(F \circ \sigma) : \Delta^1 \times \Delta^1 \rightarrow \mathcal{D}$ is a pushout square in the ∞ -category \mathcal{D} .

03FU **Proposition 7.6.3.13.** *Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, which we represent by a diagram*

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X. \end{array}$$

Then σ is a pullback diagram in \mathcal{C} if and only if it exhibits X_{01} as a product of X_0 with X_1 in the slice ∞ -category $\mathcal{C}_{/X}$.

Proof. This is a special case of Remark 7.1.2.11. \square

Stated more informally, a fiber product $X_0 \times_X X_1$ (formed in an ∞ -category \mathcal{C}) is a product of X_0 with X_1 in the ∞ -category $\mathcal{C}_{/X}$.

03FV **Corollary 7.6.3.14.** *Let \mathcal{C} be an ∞ -category. Then \mathcal{C} admits pullbacks if and only if, for each object $X \in \mathcal{C}$, the slice ∞ -category $\mathcal{C}_{/X}$ admits finite products.*

Proof. By virtue of Proposition 7.6.3.13, the ∞ -category \mathcal{C} admits pullbacks if and only if, for every object $X \in \mathcal{C}$, the ∞ -category $\mathcal{C}_{/X}$ admits pairwise products. Since $\mathcal{C}_{/X}$ has an initial object (given by the identity morphism $\text{id}_X : X \rightarrow X$; see Proposition 4.6.6.22), this is equivalent to the requirement that $\mathcal{C}_{/X}$ admits finite products (Corollary 7.6.1.20). \square

03FW **Remark 7.6.3.15.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between ∞ -categories, where \mathcal{C} admits pullbacks. Then F preserves pullbacks if and only if, for each object $X \in \mathcal{C}$, the induced functor $\mathcal{C}_{/X} \rightarrow \mathcal{D}_{/F(X)}$ preserves finite products.

03FX **Corollary 7.6.3.16.** *Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, which we represent by a diagram*

$$\begin{array}{ccc} X & \xrightarrow{f_0} & X_0 \\ \downarrow f_1 & & \downarrow \\ X_1 & \longrightarrow & \mathbf{1}. \end{array}$$

Suppose that $\mathbf{1}$ is a final object of \mathcal{C} . Then σ is a pullback square if and only if the morphisms f_0 and f_1 exhibit X as a coproduct of X_0 with X_1 in the ∞ -category \mathcal{C} .

Proof. The assumption that $\mathbf{1}$ is final guarantees that the projection map $\mathcal{C}_{/\mathbf{1}} \rightarrow \mathcal{C}$ is a trivial Kan fibration (Proposition 4.6.6.10), so that the desired result follows from the criterion of Proposition 7.6.3.13. \square

Proposition 7.6.3.17. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of ∞ -categories and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, represented informally by the diagram*

$$\begin{array}{ccc} X' & \xrightarrow{f'} & Y' \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y. \end{array}$$

Then:

- (1) *If f is U -cartesian, then σ is a U -pullback square if and only if f' is also U -cartesian.*
- (2) *If f' is U -cocartesian, then σ is a U -pushout square if and only if f is also U -cocartesian.*

Proof. We will prove (1); the proof of (2) is similar. Note that σ restricts to a diagram

$$\sigma_0 : N_{\bullet}(\{(0, 1) < (1, 1) > (1, 0)\}) \rightarrow \mathcal{C}$$

satisfying $\sigma_0(0, 1) = X$, $\sigma_0(1, 1) = Y$, and $\sigma_0(1, 0) = Y'$. The assumption that f is U -cartesian guarantees that σ_0 is U -right Kan extended from the full subcategory

$$\{1\} \times \Delta^1 \subseteq N_{\bullet}(\{(0, 1) < (1, 1) > (1, 0)\}).$$

It follows that σ is a U -pullback diagram if and only if the restriction $\sigma|_{N_{\bullet}(\{(0, 0) < (1, 0) < (1, 1)\})}$ is a U -limit diagram (Proposition 7.3.8.1). By virtue of Corollary 7.2.2.5, this is equivalent to the requirement that f' is U -cartesian. \square

Corollary 7.6.3.18. *Let \mathcal{C} be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, represented informally by the diagram*

$$\begin{array}{ccc} X' & \xrightarrow{f'} & Y' \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y. \end{array}$$

Then:

- (1) If f is an isomorphism, then σ is a pullback square if and only if f' is also an isomorphism.
- (2) If f' is an isomorphism, then σ is a pushout square if and only if f is also an isomorphism.

Proof. Combine Proposition 7.6.3.17 with Remark 7.6.3.7 (and Example 5.1.1.4). \square

03FZ Proposition 7.6.3.19 (Transitivity). *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\sigma : \Delta^2 \times \Delta^1 \rightarrow \mathcal{C}$ be diagram, which we depict informally as*

03G0

$$\begin{array}{ccccc} X' & \longrightarrow & Y' & \longrightarrow & Z' \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & Y & \longrightarrow & Z. \end{array} \quad (7.54)$$

Then:

- (1) Assume that the right square of (7.54) is a U -pullback. Then the left square is a U -pullback if and only if the outer rectangle is a U -pullback.
- (2) Assume that the left square of (7.54) is a U -pushout. Then the left square is a U -pushout if and only if the outer rectangle is a U -pushout.

Proof. We will prove (1); the proof of (2) is similar. Let A denote the partially ordered set $([2] \times [1]) \setminus \{(0, 0)\}$. Note that the inclusion maps

$$A \setminus \{(2, 0), (2, 1)\} \hookrightarrow A \quad A \setminus \{(1, 0), (1, 1)\} \hookrightarrow A \setminus \{(1, 0)\}$$

admit right adjoints, and therefore induce left cofinal morphisms

$$N_\bullet(A \setminus \{(2, 0), (2, 1)\}) \hookrightarrow N_\bullet(A) \quad N_\bullet(A \setminus \{(1, 0), (1, 1)\}) \hookrightarrow N_\bullet(A \setminus \{(1, 0)\})$$

(Corollary 7.2.3.7). Applying Corollary 7.2.2.2, we obtain the following:

- The left square of (7.54) is a U -pullback diagram if and only if σ is a U -limit diagram.
- The outer rectangle of (7.54) is a U -pullback diagram if and only if the restriction $\sigma|_{N_\bullet(([2] \times [1]) \setminus \{(1, 0)\})}$ is a U -limit diagram.

If the right square of (7.54) is a U -pullback diagram, then $\sigma|_{N_\bullet(A)}$ is U -right Kan extended from $\sigma|_{N_\bullet(A \setminus \{(1, 0)\})}$, so the desired equivalence follows from Proposition 7.3.8.1. \square

Proposition 7.6.3.20 (Rewriting Limits as Pullbacks). *Suppose we are given a categorical 03G1 pushout square of simplicial sets*

$$\begin{array}{ccc} K & \longrightarrow & K_0 \\ \downarrow & & \downarrow \\ K_1 & \longrightarrow & K_{01}. \end{array}$$

Let \mathcal{C} be an ∞ -category which admits pullbacks. If \mathcal{C} admits K -indexed limits, K_0 -indexed limits, and K_1 -indexed limits, then it also admits K_{01} -indexed limits. Moreover, if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories which preserves pullback squares, K -indexed limits, K_0 -indexed limits, and K_1 -indexed limits, then F also preserves K -indexed limits.

Proof. Combine Corollary 7.5.8.5 with (the dual of) Corollary 7.5.8.13. \square

Corollary 7.6.3.21. *Let \mathcal{C} be an ∞ -category. Then \mathcal{C} admits finite limits if and only if 03G2 it admits pullbacks and has a final object. If these conditions are satisfied, then a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves finite limits if and only if it preserves pullbacks and final objects.*

Proof. We will prove the first assertion; the second follows by a similar argument. Assume that the ∞ -category \mathcal{C} admits pullbacks and has a final object; we wish to show that \mathcal{C} admits K -indexed limits for every finite simplicial set K (the converse is immediate from the definitions). We proceed by induction on the dimension of K . If K is empty, then the desired result follows from our assumption that \mathcal{C} has an initial object. Let us therefore assume that K has dimension $n \geq 0$, and proceed also by induction on the number of nondegenerate n -simplices of K . It follows from Proposition 1.1.3.13 that there exists a pushout square of simplicial sets

$$\begin{array}{ccc} \partial\Delta^n & \longrightarrow & \Delta^n \\ \downarrow & & \downarrow \\ K' & \longrightarrow & K, \end{array}$$

where K' is a simplicial subset of K . Since the horizontal maps are monomorphisms, this pushout square is also a categorical pushout square (Example 4.5.4.12). By virtue of Proposition 7.6.3.20, it will suffice to show that the ∞ -category \mathcal{C} admits K' -indexed limits, $\partial\Delta^n$ -indexed limits, and Δ^n -indexed limits. In the first two cases, this follows from our inductive hypothesis. To handle the third case, we observe that the inclusion $\{0\} \hookrightarrow \Delta^n$ is left cofinal (Example 4.3.7.11). Using Corollary 7.2.2.12, we are reduced to proving that \mathcal{C} admits Δ^0 -indexed limits, which is immediate (see Example 7.1.1.5). \square

7.6.4 Examples of Pullback and Pushout Squares

03G3 We now give some examples of ∞ -categorical pullback diagrams.

03G4 **Proposition 7.6.4.1.** *Let \mathcal{C} be a locally Kan simplicial category and let $\sigma :$*

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

be a commutative diagram in \mathcal{C} . The following conditions are equivalent:

(1) *The composite map*

$$\Delta^1 \times \Delta^1 \xrightarrow{N_\bullet(\sigma)} N_\bullet(\mathcal{C}) \hookrightarrow N_\bullet^{hc}(\mathcal{C})$$

is a pullback square in the ∞ -category $N_\bullet^{hc}(\mathcal{C})$ (in the sense of Definition 7.6.3.1).

(2) *For every object $Y \in \mathcal{C}$, the diagram of Kan complexes*

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{C}}(Y, X_{01})_\bullet & \longrightarrow & \mathrm{Hom}_{\mathcal{C}}(Y, X_0)_\bullet \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathcal{C}}(Y, X_1)_\bullet & \longrightarrow & \mathrm{Hom}_{\mathcal{C}}(Y, X)_\bullet \end{array}$$

is a homotopy pullback square (in the sense of Definition 3.4.1.1).

Proof. Combine Corollary 7.5.4.6 with Proposition 7.5.4.13. \square

03G5 **Example 7.6.4.2.** A (strictly) commutative diagram of Kan complexes

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

is a homotopy pullback square (in the sense of Definition 3.4.1.1) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow N_\bullet^{hc}(\mathrm{Kan}) = \mathcal{S}$ is a pullback square in the ∞ -category of spaces \mathcal{S} . This follows by combining Propositions 7.5.4.13 and 7.5.4.5.

Example 7.6.4.3. A (strictly) commutative diagram of Kan complexes

03G6

$$\begin{array}{ccc} A & \longrightarrow & A_0 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A_{01} \end{array}$$

is a homotopy pushout square (in the sense of Definition 3.4.2.1) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow N_\bullet^{hc}(\text{Kan}) = \mathcal{S}$ is a pushout square in the ∞ -category of spaces \mathcal{S} . This follows by combining Corollaries 7.5.7.7 and 7.5.7.9.

Example 7.6.4.4. A (strictly) commutative diagram of ∞ -categories

03G7

$$\begin{array}{ccc} \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C} \end{array}$$

is a categorical pullback square (in the sense of Definition 4.5.2.7) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow N_\bullet^{hc}(\text{QCat}) = \mathcal{QC}$ is a pullback square in the ∞ -category \mathcal{QC} . This follows by combining Corollaries 7.5.5.8 and 7.5.5.10.

Example 7.6.4.5. A (strictly) commutative diagram of ∞ -categories

03G8

$$\begin{array}{ccc} \mathcal{C} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C}_{01} \end{array}$$

is a categorical pushout square (in the sense of Definition 4.5.4) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow N_\bullet^{hc}(\text{QCat}) = \mathcal{QC}$ is a pushout square in the ∞ -category \mathcal{QC} . This follows by combining Corollaries 7.5.8.5 and 7.5.8.9.

Recall that the ∞ -category of spaces \mathcal{S} admits small limits and colimits (Corollary 7.4.5.6). In particular, if $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ are morphisms of Kan complexes,

then there exists a pullback diagram σ :

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in the ∞ -category \mathcal{S} . However, it is not always possible to obtain σ from a commutative diagram in the ordinary category Kan. It will therefore be useful to have a generalization of Proposition 7.6.4.1, which applies to *homotopy coherent* squares.

03G9 **Remark 7.6.4.6** (Homotopy Coherent Squares). Let \mathcal{C} be a simplicial category and let $N_\bullet^{\text{hc}}(\mathcal{C})$ denote the homotopy coherent nerve of \mathcal{C} . Combining Examples 1.4.2.9, 2.4.3.9, and 2.4.3.10, we see that morphisms from $\Delta^1 \times \Delta^1$ to $N_\bullet^{\text{hc}}(\mathcal{C})$ can be identified with the following data:

- (a) A collection of objects X_{01} , X_0 , X_1 , and X of the category \mathcal{C} .
- (b) A collection of morphisms $f_0 : X_0 \rightarrow X$, $f_1 : X_1 \rightarrow X$, $g_0 : X_{01} \rightarrow X_0$, $g_1 : X_{01} \rightarrow X_1$.
- (c) A morphism $h : X_{01} \rightarrow X$ in \mathcal{C} together with a pair of edges $\alpha_0 : f_0 \circ g_0 \rightarrow h$ and $\alpha_1 : f_1 \circ g_1 \rightarrow h$ in the simplicial set $\text{Hom}_{\mathcal{C}}(X_{01}, X)_\bullet$.

We can summarize this data in a diagram

$$\begin{array}{ccccc} X_{01} & \xrightarrow{g_0} & X_0 & & \\ \downarrow g_1 & \searrow h & \downarrow f_0 & & \\ X_1 & \xrightarrow{f_1} & X & & \end{array}$$

α_0

α_1

Here we can regard (a) and (b) as supplying a (potentially) non-commutative square diagram in the category \mathcal{C} , and (c) as supplying a witness to the fact that it commutes up to homotopy.

Example 7.6.4.7 (Square Diagrams in \mathcal{QC}). Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors 03GA of ∞ -categories. Using Remark 7.6.4.6, we see that the data of a commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow F_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C} \end{array}$$

in the ∞ -category \mathcal{QC} is equivalent to the data of an ∞ -category \mathcal{C}_{01} equipped with functors

$$G_0 : \mathcal{C}_{01} \rightarrow \mathcal{C}_0 \quad G_1 : \mathcal{C}_{01} \rightarrow \mathcal{C}_1 \quad H : \mathcal{C}_{01} \rightarrow \mathcal{C}$$

together with natural isomorphisms $\alpha_0 : (F_0 \circ G_0) \xrightarrow{\sim} H$ and $\alpha_1 : (F_1 \circ G_1) \xrightarrow{\sim} H$. In this case, we can identify the data of the tuple $(G_0, \alpha_0, G_1, \alpha_1, H)$ with a single functor of ∞ -categories

$$G : \mathcal{C}_{01} \rightarrow \mathcal{C}_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}).$$

Proposition 7.6.4.8. Suppose we are given a commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow F_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C} \end{array} \tag{7.55}$$

in the ∞ -category \mathcal{QC} , corresponding to a functor

$$G : \mathcal{C}_{01} \rightarrow \mathcal{C}_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}).$$

Then (7.55) is a pullback square in \mathcal{QC} if and only if the functor G is an equivalence of ∞ -categories.

Proof. Let us identify the diagram (7.55) with a functor of simplicial categories $\mathcal{F} : \text{Path}[1] \times [1]_{\bullet} \rightarrow \text{QCat}$. Using Corollary 5.3.7.7, we can factor the functor F_0 as a composition $\mathcal{C}_0 \xrightarrow{T} \mathcal{C}'_0 \xrightarrow{F'_0} \mathcal{C}$, where T is an equivalence of ∞ -categories and F'_0 is an isofibration. Let \mathcal{C}'_{01} denote the iterated homotopy fiber product $\mathcal{C}'_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C})$. Then Example 7.6.4.7 supplies a commutative diagram

$$\begin{array}{ccc} \mathcal{C}'_{01} & \longrightarrow & \mathcal{C}'_0 \\ \downarrow & & \downarrow F'_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C} \end{array} \tag{7.56}$$

in the ∞ -category \mathcal{QC} , which we view as a functor of simplicial categories $\mathcal{F}' : \text{Path}[[1] \times [1]]_{\bullet} \rightarrow \text{QCat}$. The morphisms G and T determine a natural transformation of simplicial functors $\mathcal{F} \rightarrow \mathcal{F}'$, which induces a natural transformation from the diagram (7.55) to the diagram (7.56) in the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{QC})$. By virtue of Corollary 4.5.2.19, this natural transformation is an isomorphism of diagrams if and only if the functor G is an equivalence of ∞ -categories. Consequently, Proposition 7.6.4.8 is equivalent to the assertion that (7.56) is a pullback square in the ∞ -category \mathcal{QC} (see Proposition 7.1.2.13).

Note that we have a (strictly) commutative diagram of simplicial sets

$$\begin{array}{ccc} 03GE & \mathcal{C}'_0 \times_{\mathcal{C}} \mathcal{C}_1 & \longrightarrow \mathcal{C}'_0 \\ & \downarrow & \downarrow F'_0 \\ & \mathcal{C}_1 & \xrightarrow{F'_1} \mathcal{C}, \end{array} \tag{7.57}$$

which determines a subfunctor $\mathcal{F}'' \subseteq \mathcal{F}'$. Since F'_0 is an isofibration, it follows from Corollary 4.5.2.23, Proposition 5.3.7.6, and Corollary 4.5.2.24 that the inclusion maps

$$\begin{aligned} \mathcal{C}'_0 \times_{\mathcal{C}} \mathcal{C}_1 &\hookrightarrow \mathcal{C}'_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \\ &\hookrightarrow \mathcal{C}'_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}) \end{aligned}$$

are equivalences of ∞ -categories. Consequently, the inclusion $\mathcal{F}'' \hookrightarrow \mathcal{F}'$ is a levelwise categorical equivalence of simplicial functors and therefore induces an isomorphism from the diagram (7.57) to the diagram (7.56) in the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$. By virtue of Proposition 7.1.2.13, it will suffice to show that the diagram (7.57) is a pullback square in the ∞ -category \mathcal{QC} . This is a special case of Example 7.6.4.4, since (7.57) is a categorical pullback square (see Corollary 4.5.2.22). \square

03GF **Corollary 7.6.4.9.** *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories, let let $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ denote the homotopy fiber product of Construction 4.5.2.1, and let*

$$G_0 : \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \rightarrow \mathcal{C}_0 \quad G_1 : \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \rightarrow \mathcal{C}_1$$

denote the projection maps, so that we have a canonical isomorphism $\alpha : F_0 \circ G_0 \rightarrow F_1 \circ G_1$

in the ∞ -category $\text{Fun}(\mathcal{C}_0 \times_{\mathcal{C}}^{\text{h}} \mathcal{C}_1, \mathcal{C})$. Then the diagram

$$\begin{array}{ccc}
 \mathcal{C}_0 \times_{\mathcal{C}}^{\text{h}} \mathcal{C}_1 & \xrightarrow{G_0} & \mathcal{C}_0 \\
 \downarrow G_1 & \searrow F_1 \circ G_1 & \downarrow F_0 \\
 \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C}
 \end{array}$$

The diagram shows a pullback square. The top horizontal arrow is G_0 , the right vertical arrow is F_0 , the bottom horizontal arrow is F_1 , and the left vertical arrow is G_1 . There are two diagonal arrows from the top-left corner to the bottom-right corner: one labeled α and another labeled id .

corresponds to a pullback square in the ∞ -category \mathcal{QC} . In particular, $\mathcal{C}_0 \times_{\mathcal{C}}^{\text{h}} \mathcal{C}_1$ is a fiber product of \mathcal{C}_0 with \mathcal{C}_1 over \mathcal{C} in the ∞ -category \mathcal{QC} .

Proof. By virtue of Proposition 7.6.4.8, it will suffice to show that the inclusion

$$\delta : \mathcal{C}_1 \simeq \mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C} \hookrightarrow \mathcal{C}_1 \times_{\mathcal{C}}^{\text{h}} \mathcal{C}$$

induces an equivalence of homotopy fiber products

$$\mathcal{C}_0 \times_{\mathcal{C}}^{\text{h}} \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times_{\mathcal{C}}^{\text{h}} (\mathcal{C}_1 \times_{\mathcal{C}}^{\text{h}} \mathcal{C}).$$

This is a special case of Corollary 4.5.2.19, since δ is an equivalence of ∞ -categories (Proposition 5.3.7.6). \square

Corollary 7.6.4.10. Suppose we are given a commutative diagram

03GG

$$\begin{array}{ccc}
 X_{01} & \longrightarrow & X_0 \\
 \downarrow & & \downarrow \\
 X_1 & \longrightarrow & X
 \end{array}$$

(7.58) 03GH

in the ∞ -category \mathcal{S} , classified by a map of Kan complexes

$$g : X_{01} \rightarrow X_0 \times_X^{\text{h}} (X_1 \times_X^{\text{h}} X).$$

Then (7.58) is a pullback square in \mathcal{S} if and only if g is a homotopy equivalence.

Proof. Combine Propositions 7.6.4.8 and 7.4.5.1. \square

03GJ **Example 7.6.4.11.** Let $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ be morphisms of Kan complexes. Applying the construction of Corollary 7.6.4.9, we obtain a pullback square

$$\begin{array}{ccc} X_0 \times_X^h X_1 & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in the ∞ -category \mathcal{S} .

03GK **Corollary 7.6.4.12.** Let \mathcal{C} be a locally Kan simplicial category, and suppose we are given a commutative diagram $\sigma : \Delta^1 \times \Delta^1 \rightarrow N_\bullet^{hc}(\mathcal{C})$, corresponding to a diagram

$$\begin{array}{ccc} X_{01} & \xrightarrow{g_0} & X_0 \\ g_1 \downarrow & \searrow h & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

α_0

α_1

in the ∞ -category \mathcal{C} (see Remark 7.6.4.6). Then σ is a pullback square in the ∞ -category $N_\bullet^{hc}(\mathcal{C})$ if and only if, for every object $Y \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, X_{01})_\bullet \rightarrow \mathrm{Hom}_{\mathcal{C}}(Y, X_0)_\bullet \times_{\mathrm{Hom}_{\mathcal{C}}(Y, X)_\bullet}^h (\mathrm{Hom}_{\mathcal{C}}(Y, X_1)_\bullet \times_{\mathrm{Hom}_{\mathcal{C}}(Y, X)_\bullet}^h \mathrm{Hom}_{\mathcal{C}}(Y, X)_\bullet)$$

is a homotopy equivalence of Kan complexes.

Proof. Combine Corollary 7.6.4.10 with Proposition 7.4.5.13. \square

7.6.5 Equalizers and Coequalizers

03GL We now study (co)limits of a particularly simple shape.

03GM **Notation 7.6.5.1.** Let $(\bullet \rightrightarrows \bullet)$ denote the simplicial set given by the pushout $\Delta^1 \coprod_{\partial\Delta^1} \Delta^1$. For any ∞ -category \mathcal{C} , we will identify morphisms from $(\bullet \rightrightarrows \bullet)$ to \mathcal{C} with pairs (f_0, f_1) , where $f_0 : Y \rightarrow X$ and $f_1 : Y \rightarrow X$ are morphisms of \mathcal{C} having the same source and target.

03GN **Remark 7.6.5.2.** The simplicial set $(\bullet \rightrightarrows \bullet)$ of Notation 7.6.5.1 is isomorphic to the nerve of its homotopy category \mathcal{J} , which can be described concretely as follows:

- The category \mathcal{J} has exactly two objects Y and X .
- There are exactly two non-identity morphisms in \mathcal{J} , both of which have source Y and target X .

Remark 7.6.5.3. There is a tautological epimorphism of simplicial sets

03GP

$$\begin{aligned} (\bullet \rightrightarrows \bullet) &= \Delta^1 \coprod_{\partial\Delta^1} \Delta^1 \\ &\twoheadrightarrow \Delta^1 \coprod_{\partial\Delta^1} \Delta^0 \\ &= \Delta^1 / \partial\Delta^1. \end{aligned}$$

It follows from Example 6.3.4.4 that this epimorphism exhibits $\Delta^1 / \partial\Delta^1$ as a localization of $(\bullet \rightrightarrows \bullet)$. In particular, it is both left and right cofinal (Proposition 7.2.1.10).

Definition 7.6.5.4 (Equalizers and Coequalizers). Let \mathcal{C} be an ∞ -category and let $f_0, f_1 : Y \rightarrow X$ be morphisms of \mathcal{C} having the same source and target, which we identify with functor $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{C}$. An *equalizer* of f_0 and f_1 is a limit of the diagram σ . A *coequalizer* of f_0 and f_1 is a colimit of the diagram σ . We say that the ∞ -category \mathcal{C} *admits equalizers* if every pair of morphisms $f_0, f_1 : Y \rightarrow X$ have an equalizer in \mathcal{C} , and that \mathcal{C} *admits coequalizers* if every pair of morphisms $f_0, f_1 : Y \rightarrow X$ have a coequalizer in \mathcal{C} .

Notation 7.6.5.5. Let \mathcal{C} be an ∞ -category and let $f_0, f_1 : Y \rightarrow X$ be morphisms of \mathcal{C} having the same source and target. If there exists an object $Z \in \mathcal{C}$ which is an equalizer of f_0 and f_1 , then Z is uniquely determined up to isomorphism (Proposition 7.1.1.12). To emphasize this uniqueness, we denote the object Z (if it exists) by $\text{Eq}(f_0, f_1)$. Similarly, if there exists an object $W \in \mathcal{C}$ which is a coequalizer of f_0 and f_1 , then W is uniquely determined up to isomorphism; to emphasize this, we denote W by $\text{Coeq}(f_0, f_1)$.

Remark 7.6.5.6 (Duality). The simplicial set $(\bullet \rightrightarrows \bullet)$ is canonically isomorphic to its opposite $(\bullet \rightrightarrows \bullet)^{\text{op}}$. Consequently, if $f_0, f_1 : Y \rightarrow X$ are morphisms in an ∞ -category \mathcal{C} which admit an equalizer $Z = \text{Eq}(f_0, f_1)$, then Z can be regarded as a coequalizer of f_0 and f_1 in the opposite ∞ -category \mathcal{C}^{op} .

Remark 7.6.5.7 (Symmetry). The simplicial set $(\bullet \rightrightarrows \bullet)$ has a unique nontrivial automorphism, which exchanges its nondegenerate edges. It follows that, if $f_0, f_1 : Y \rightarrow X$ are a pair of morphisms in an ∞ -category \mathcal{C} , then we can identify (co)equalizers of the pair (f_0, f_1) with (co)equalizers of the pair (f_1, f_0) .

Example 7.6.5.8 (Fixed Points of Endomorphisms). Let \mathcal{C} be an ∞ -category and let X be an object of \mathcal{C} . An *endomorphism* of X is a morphism $f : X \rightarrow X$ from the object X

to itself. Note that the pair (X, f) can be identified with a morphism of simplicial sets $\sigma : (\Delta^1 / \partial\Delta^1) \rightarrow \mathcal{C}$. It follows from Remark 7.6.5.3 (together with Corollary 7.2.2.11) that an object of \mathcal{C} is a limit of the diagram σ if and only if it is an equalizer of the pair of morphisms $f, \text{id}_X : X \rightarrow X$. Similarly, an object of \mathcal{C} is a colimit of σ if and only if it is a coequalizer of the pair (f, id_X) .

03GV **Variant 7.6.5.9.** Let $\mathbf{Z}_{\geq 0}$ denote the collection of nonnegative integers, which we regard as a commutative monoid under addition, and let $B_{\bullet}\mathbf{Z}_{\geq 0}$ denote the classifying simplicial set of Example 1.2.4.3. The simplicial set $B_{\bullet}\mathbf{Z}_{\geq 0}$ is an ∞ -category which contains a (unique) object X , and the generator $1 \in \mathbf{Z}_{\geq 0}$ determines an endomorphism $e : X \rightarrow X$. We can regard $B_{\bullet}\mathbf{Z}_{\geq 0}$ as *freely generated* by the endomorphism e : more precisely, the pair (X, e) determines a morphism of simplicial sets $\sigma : \Delta^1 / \partial\Delta^1 \hookrightarrow B_{\bullet}\mathbf{Z}_{\geq 0}$ which is inner anodyne (see Example 1.4.7.10), and therefore induces a trivial Kan fibration $\text{Fun}(B_{\bullet}\mathbf{Z}_{\geq 0}, \mathcal{C}) \rightarrow \text{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C})$ for every ∞ -category \mathcal{C} . In particular, the morphism σ is both left and right cofinal (Proposition 7.2.1.3).

If $F : B_{\bullet}\mathbf{Z}_{\geq 0} \rightarrow \mathcal{C}$ is a functor of ∞ -categories, then Corollary 7.2.2.11 guarantees that an object of \mathcal{C} is a limit of the functor F if and only if it is a limit of the diagram $F \circ \sigma$: that is, if and only if it is an equalizer of the pair of morphisms $F(e), \text{id}_{F(X)} : F(X) \rightarrow F(X)$ (see Example 7.6.5.8). Similarly, an object of \mathcal{C} is a colimit of the functor F if and only if it is a coequalizer of the pair $(F(e), \text{id}_{F(X)})$.

03GW **Definition 7.6.5.10** (Equalizer and Coequalizer Diagrams). Let \mathcal{C} be an ∞ -category. An *equalizer diagram* in \mathcal{C} is a limit diagram $(\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{C}$. A *coequalizer diagram* is a colimit diagram $(\bullet \rightrightarrows \bullet)^{\triangleright} \rightarrow \mathcal{C}$.

03GX **Warning 7.6.5.11.** Let \mathcal{C} be an ∞ -category and suppose we are given an equalizer diagram

$$03GY \quad Z \xrightarrow{g} Y \rightrightarrows \begin{matrix} f_0 \\ f_1 \end{matrix} X \tag{7.59}$$

in \mathcal{C} . Then the image of (7.59) in the homotopy category $\text{h}\mathcal{C}$ need not be an equalizer diagram. In other words, the forgetful functor $\mathcal{C} \rightarrow \text{N}_{\bullet}(\text{h}\mathcal{C})$ does not preserve equalizer diagrams in general.

03GZ **Example 7.6.5.12.** Let X be a Kan complex containing vertices x and y . Then there exists an equalizer diagram

$$03H0 \quad \{x\} \times_X^h \{y\} \xrightarrow{f} \Delta^0 \rightrightarrows \begin{matrix} x \\ y \end{matrix} X \tag{7.60}$$

in the ∞ -category \mathcal{S} (for a more general statement, see Corollary 7.6.5.21). However, unless the homotopy fiber product $\{x\} \times_X^h \{y\}$ is either empty or contractible, the image of (7.60) in the homotopy category hKan is not an equalizer diagram (since the homotopy class $[f]$ is not a monomorphism in hKan).

Exercise 7.6.5.13. Let \mathcal{C} be an ∞ -category and suppose we are given an equalizer diagram 03H1

$$Z \xrightarrow{g} Y \rightrightarrows X \quad (7.61) \quad 03H2$$

in \mathcal{C} . Show that, for every object $C \in \mathcal{C}$, the map of sets

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Z) \xrightarrow{[g] \circ} \mathrm{Eq}(\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Y) \rightrightarrows \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, X))$$

is surjective (though it is generally not injective).

We now give some examples of (co)equalizer diagrams.

Proposition 7.6.5.14. Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, and let $G : \mathcal{E} \rightarrow \mathcal{D}$ 03H3 be a functor of ∞ -categories satisfying $F_0 \circ G = F_1 \circ G$. The following conditions are equivalent:

- (1) The resulting diagram of ∞ -categories $(\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{QC}$ is an equalizer diagram.
- (2) The commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{G} & \mathcal{D} \\ \downarrow & & \downarrow (F_0, F_1) \\ \mathcal{C} & \xrightarrow{(\mathrm{id}, \mathrm{id})} & \mathcal{C} \times \mathcal{C} \end{array} \quad (7.62) \quad 03H4$$

is a categorical pullback square (Definition 4.5.2.7).

Proof. Let us identify the pair (F_0, F_1) with a functor of ordinary categories $\mathcal{F} : \mathcal{J} \rightarrow \mathrm{QCat}$, where \mathcal{J} is the category described in Remark 7.6.5.2. The functor G then induces a map $\mathcal{E} \rightarrow \varprojlim(\mathcal{F})$, which can be identified with the map

$$\mathcal{E} \rightarrow \mathcal{C} \times_{(\mathcal{C} \times \mathcal{C})}^{\mathrm{h}} \mathcal{D}$$

determined by the diagram (7.62). Proposition 7.6.5.14 now follows from the criterion of Corollary 7.5.5.8. \square

Corollary 7.6.5.15. Let $f_0, f_1 : Y \rightarrow X$ be morphisms of Kan complexes and let $g : Z \rightarrow Y$ 03H5 be a morphism of Kan complexes satisfying $f_0 \circ g = f_1 \circ g$. The following conditions are equivalent:

- (1) The resulting diagram of ∞ -categories $(\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{S}$ is an equalizer diagram.

(2) *The commutative diagram of Kan complexes*

$$\begin{array}{ccc} Z & \xrightarrow{g} & Y \\ \downarrow & & \downarrow (f_0, f_1) \\ X & \xrightarrow{(\text{id}, \text{id})} & X \times X \end{array}$$

is a homotopy pullback square.

Proof. Combine Propositions 7.6.5.14 and 7.4.5.1. \square

03H6 **Corollary 7.6.5.16.** *Let \mathcal{C} be a locally Kan simplicial category and suppose we are given morphisms*

$$Z \xrightarrow{g} Y \rightrightarrows X \xrightarrow{f_0} X \xrightarrow{f_1}$$

in \mathcal{C} satisfying $f_0 \circ g = f_1 \circ g$. The following conditions are equivalent:

- (1) *The induced diagram $(\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow N_{\bullet}^{\text{hc}}(\mathcal{C})$ is an equalizer diagram in the ∞ -category $N_{\bullet}^{\text{hc}}(\mathcal{C})$, in the sense of Definition 7.6.5.10.*
- (2) *For every object $C \in \mathcal{C}$, the diagram of Kan complexes*

$$\begin{array}{ccc} \text{Hom}_{\mathcal{C}}(C, Z)_{\bullet} & \longrightarrow & \text{Hom}_{\mathcal{C}}(C, Y)_{\bullet} \\ \downarrow g & & \downarrow \\ \text{Hom}_{\mathcal{C}}(C, X)_{\bullet} & \xrightarrow{(f_0, f_1)} & \text{Hom}_{\mathcal{C}}(C, X)_{\bullet} \times \text{Hom}_{\mathcal{C}}(C, X)_{\bullet} \end{array}$$

is a homotopy pullback square.

Proof. Combine Corollary 7.6.5.15 with Proposition 7.4.5.13. \square

Let $f_0, f_1 : Y \rightarrow X$ be morphisms of Kan complexes. By virtue of Corollary 7.4.5.6, the morphisms f_0 and f_1 have an equalizer in the ∞ -category \mathcal{S} . Beware that this equalizer generally cannot be obtained from Corollary 7.6.5.15. For example, if f_0 and f_1 have disjoint images, then the existence of a morphism $g : Z \rightarrow Y$ satisfying $f_0 \circ g = f_1 \circ g$ guarantees that the simplicial set Z is empty. In such cases, to extend the pair (f_0, f_1) to an equalizer diagram in \mathcal{S} , we are forced to consider homotopy coherent diagrams which do not strictly commute.

Remark 7.6.5.17. Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, which we identify with 03H7 a diagram $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{QC}$. Unwinding the definitions, we see that extensions of σ to a diagram $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{QC}$ can be identified with the following data:

- An ∞ -category \mathcal{E} equipped with functors $G : \mathcal{E} \rightarrow \mathcal{D}$ and $H : \mathcal{E} \rightarrow \mathcal{C}$.
- Isomorphisms $\alpha_0 : F_0 \circ G \xrightarrow{\sim} H$ and $\alpha_1 : F_1 \circ G \xrightarrow{\sim} H$ in the ∞ -category $\text{Fun}(\mathcal{E}, \mathcal{C})$.

In this case, we can identify the quadruple $(G, H, \alpha_0, \alpha_1)$ with a single functor of ∞ -categories

$$U : \mathcal{E} \rightarrow \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C}.$$

Proposition 7.6.5.18. Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, which we identify 03H8 with a diagram $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{QC}$. Suppose we are given an extension $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{QC}$ of σ , corresponding to a functor of ∞ -categories

$$T : \mathcal{E} \rightarrow \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C}.$$

Then $\bar{\sigma}$ is an equalizer diagram in the ∞ -category \mathcal{QC} if and only if T is an equivalence of ∞ -categories.

Proof. We proceed as in the proof of Proposition 7.6.4.8, with minor modifications. Let \mathcal{A} denote the simplicial path category of $(\bullet \rightrightarrows \bullet)^{\triangleleft}$, so that we can identify $\bar{\sigma}$ with a simplicial functor $\mathcal{F} : \mathcal{A} \rightarrow \text{QCat}$. Using Corollary 5.3.7.7, we can factor the functor $(F_0, F_1) : \mathcal{D} \rightarrow \mathcal{C} \times \mathcal{C}$ as a composition

$$\mathcal{D} \xrightarrow{U} \mathcal{D}' \xrightarrow{(F'_0, F'_1)} \mathcal{C} \times \mathcal{C},$$

where U is an equivalence of ∞ -categories and (F'_0, F'_1) is an isofibration. The pair (F'_0, F'_1) can be identified with a morphism of simplicial sets $\sigma' : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{QC}$. Applying Remark 7.6.5.17, we can extend σ' to a diagram $\bar{\sigma}' : (\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{QC}$, carrying the cone point to the ∞ -category $\mathcal{E}' = \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C}$. The diagram $\bar{\sigma}'$ corresponds to a simplicial functor $\mathcal{F}' : \mathcal{A} \rightarrow \text{QCat}$. The morphisms T and U determine a natural transformation of simplicial functors $\mathcal{F} \rightarrow \mathcal{F}'$, hence also a morphism $\bar{\sigma} \rightarrow \bar{\sigma}'$ in the ∞ -category $\text{Fun}((\bullet \rightrightarrows \bullet)^{\triangleleft}, \mathcal{QC})$. By virtue of Corollary 4.5.2.19, this natural transformation is an isomorphism of diagrams if and only if the functor T is an equivalence of ∞ -categories. Consequently, Proposition 7.6.5.18 is equivalent to the assertion that $\bar{\sigma}'$ is an equalizer diagram in \mathcal{QC} (Proposition 7.1.2.13).

Invoking Remark 7.6.5.17 again, we obtain another diagram $\bar{\sigma}''$ extending σ' , which carries the cone point of $(\bullet \rightrightarrows \bullet)^{\triangleleft}$ to the equalizer $\text{Eq}(F'_0, F'_1) = \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}$ (formed in the category of simplicial sets). The diagram $\bar{\sigma}''$ corresponds to another simplicial functor

$\mathcal{F}'' : \mathcal{A} \rightarrow \text{QCat}$. Note that there is a natural inclusion map $\mathcal{F}'' \hookrightarrow \mathcal{F}'$, which carries the cone point to the inclusion

$$\iota : \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})} \mathcal{C} \subseteq \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C}.$$

Since (F'_0, F'_1) is an isofibration, the functor ι is an equivalence of ∞ -categories (Corollary 4.5.2.23). It follows that the inclusion $\mathcal{F}'' \hookrightarrow \mathcal{F}'$ induces an isomorphism $\bar{\sigma}'' \rightarrow \bar{\sigma}'$ in the ∞ -category $\text{Fun}((\bullet \rightrightarrows \bullet)^\triangleleft, \mathcal{QC})$. By virtue of Proposition 7.1.2.13, we are reduced to showing that $\bar{\sigma}''$ is an equalizer diagram in \mathcal{QC} . This follows from the criterion of Proposition 7.6.5.14 (since ι is an equivalence of ∞ -categories). \square

It follows from Proposition 7.6.5.18 that, if $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ are functors of ∞ -categories, then the homotopy fiber product $\mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C}$ is an equalizer of F_0 and F_1 in the ∞ -category \mathcal{QC} (this can also be viewed as a special case of Proposition 7.5.2.6). However, it is possible to be more efficient.

03H9 **Construction 7.6.5.19** (The Homotopy Equalizer). Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, and form a pullback diagram of simplicial sets

$$\begin{array}{ccc} \text{hEq}(F_0, F_1) & \longrightarrow & \text{Isom}(\mathcal{C}) \\ \downarrow G & & \downarrow \\ \mathcal{D} & \xrightarrow{(F_0, F_1)} & \mathcal{C} \times \mathcal{C}. \end{array}$$

Note that the right vertical map is an isofibration (Corollary 4.4.5.5), so the left vertical map is also an isofibration; in particular, $\text{hEq}(F_0, F_1)$ is an ∞ -category. We will refer to $\text{hEq}(F_0, F_1)$ as the *homotopy equalizer* of the functors F_0 and F_1 . By construction, objects of $\text{hEq}(F_0, F_1)$ can be identified with pairs (X, u) , where X is an object of \mathcal{D} and $u : F_0(X) \rightarrow F_1(X)$ is an isomorphism in the ∞ -category \mathcal{C} .

Set $H = G \circ F_1$, so that the construction $(X, u) \mapsto u$ determines an isomorphism $\alpha_0 : G \circ F_0 \xrightarrow{\sim} H$ in the ∞ -category $\text{Fun}(\text{Eq}(F_0, F_1), \mathcal{C})$. Taking α_1 to be the identity morphism $\text{id} : G \circ F_1 \xrightarrow{\sim} H$, we see that the quadruple $(G, H, \alpha_0, \alpha_1)$ determines a diagram $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$, carrying the cone point to the homotopy equalizer $\text{hEq}(F_0, F_1)$ (see Remark 7.6.5.17).

03HA **Corollary 7.6.5.20.** *Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ and $F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories. Then the morphism $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$ of Construction 7.6.5.19 is an equalizer diagram. In particular, the homotopy equalizer $\text{hEq}(F_0, F_1)$ is an equalizer of F_0 and F_1 in the ∞ -category \mathcal{QC} .*

Proof. The diagram $\bar{\sigma}$ can be identified with a functor $U : \text{hEq}(F_0, F_1) \rightarrow \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C}$. By virtue of Proposition 7.6.5.18, it will suffice to show that U is an equivalence of ∞ -categories. Unwinding the definitions, we see that U fits into a commutative diagram

$$\begin{array}{ccccc} \text{hEq}(F_0, F_1) & \xrightarrow{U} & \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^h \mathcal{C} & \longrightarrow & \mathcal{D} \times_{\mathcal{C}}^h \mathcal{C} \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{D} & \longrightarrow & \mathcal{D} \times_{\mathcal{C}}^h \mathcal{C} & \longrightarrow & \mathcal{D} \times \mathcal{C}, \end{array}$$

where the homotopy fiber product on the upper right is formed using the functor F_0 , and the homotopy fiber product on the lower middle is formed using the functor F_1 . Each of the squares in this diagram is a pullback, and the right vertical map is an isofibration (Remark 4.5.2.2). It follows that the left side of the diagram is a categorical pullback square (Corollary 4.5.2.22). Since the functor on the lower left is an equivalence of ∞ -categories (Proposition 5.3.7.6), it follows that U is an equivalence of ∞ -categories. \square

Corollary 7.6.5.21. *Let $f_0, f_1 : Y \rightarrow X$ be morphisms of Kan complexes. Then the 03HB homotopy equalizer $\text{hEq}(f_0, f_1)$ is a Kan complex, which is an equalizer of f_0 and f_1 in the ∞ -category \mathcal{S} .*

Proof. Combine Corollary 7.6.5.20 with Proposition 7.4.5.1. \square

Corollaries 7.6.5.20 and 7.6.5.21 illustrate a general phenomenon: if \mathcal{C} is an ∞ -category which admits pairwise products, then equalizers in \mathcal{C} can be viewed as a special kind of fiber product.

Proposition 7.6.5.22 (Rewriting Equalizers as Pullbacks). *Let \mathcal{C} be an ∞ -category, let 03HC $f_0, f_1 : Y \rightarrow X$ be morphisms of \mathcal{C} . Let $X \times X$ be a product of X with itself in the ∞ -category \mathcal{C} , so that f_0 and f_1 determine a morphism $(f_0, f_1) : Y \rightarrow X \times X$, and let $\delta_X : X \rightarrow X \times X$ be the diagonal map. Then an object of \mathcal{C} is an equalizer of f_0 and f_1 if and only if it is a fiber product of Y with X over $X \times X$.*

Proof. Let \mathcal{K} denote the simplicial set given by the product $(\bullet \rightrightarrows \bullet)^{\triangleleft} \times \Delta^1$. Then \mathcal{K} is an ∞ -category, which we depict informally by the diagram

$$\begin{array}{ccccc} z & \longrightarrow & y & \rightrightarrows & x \\ \downarrow & & \downarrow & & \downarrow \\ z' & \longrightarrow & y' & \rightrightarrows & x'. \end{array}$$

We now proceed in several steps.

- Let \mathcal{K}_0 denote the full subcategory of \mathcal{K} spanned by the objects x and y . Then \mathcal{K}_0 is isomorphic to the simplicial set $(\bullet \rightrightarrows \bullet)$. In particular, the pair of morphisms $f_0, f_1 : Y \rightarrow X$ can be identified with a functor $\sigma_0 : \mathcal{K}_0 \rightarrow \mathcal{C}$, satisfying $\sigma_0(x) = X$ and $\sigma_0(y) = Y$. By definition, an object of \mathcal{C} is an equalizer of the pair (f_0, f_1) if and only if it is a limit of the diagram σ_0 .
- Let \mathcal{K}_1 denote the full subcategory of \mathcal{K} spanned by the objects x, x' , and y . Note that the identity map $\text{id}_{\mathcal{K}_0}$ extends uniquely to a retraction $r : \mathcal{K}_1 \rightarrow \mathcal{K}_0$, carrying the object $x' \in \mathcal{K}_1$ to $x \in \mathcal{K}_0$. Let $\sigma_1 : \mathcal{K}_1 \rightarrow \mathcal{C}$ be the composition $\sigma_0 \circ r$. Note that the inclusion map $\mathcal{K}_0 \hookrightarrow \mathcal{K}_1$ admits a right adjoint (given by the retraction r), and is therefore left cofinal (Corollary 7.2.3.7). It follows that an object of \mathcal{C} is a limit of the diagram σ_0 if and only if it is a limit of the diagram σ_1 (Corollary 7.2.2.11).
- Choose a pair of morphisms $\pi_0, \pi_1 : X \times X \rightarrow X$ in the ∞ -category \mathcal{C} which exhibit $X \times X$ as a product of X with itself. The morphism $(f_0, f_1) : Y \rightarrow X$ is characterized (up to homotopy) by the requirement that there exist 2-simplices σ_0 and σ_1 of \mathcal{C} , where σ_i exhibits f_i as a composition of π_i with (f_0, f_1) . Let \mathcal{K}_2 denote the full subcategory of \mathcal{K} spanned by the objects x, x', y , and y' . Then the pair (σ_0, σ_1) determines an extension of σ_1 to a functor $\sigma_2 : \mathcal{K}_2 \rightarrow \mathcal{C}$ satisfying $\sigma_2(y') = X \times X$.
- The diagonal morphism $\delta_X : X \rightarrow X \times X$ is characterized (up to homotopy) by the requirement that there exist 2-simplices τ_0 and τ_1 of \mathcal{C} , where τ_i exhibits id_X as a composition of π_i with δ_X . Let \mathcal{K}_3 denote the full subcategory of \mathcal{K} spanned by the objects x, x', y, y' , and z' . Then the pair (τ_0, τ_1) determines an extension of σ_2 to a functor $\sigma_3 : \mathcal{K}_3 \rightarrow \mathcal{C}$ satisfying $\sigma_3(z') = X$. The diagram σ_3 can be represented informally by the diagram

$$\begin{array}{ccccc}
 & \bullet & \dashrightarrow & Y & \xrightarrow{\quad f_0 \quad} \Rightarrow X \\
 & | & & \downarrow (f_0, f_1) & \downarrow \text{id}_X \\
 X & \xrightarrow{\quad \delta_X \quad} & X \times X & \xrightarrow{\quad \pi_0 \quad} \Rightarrow X \\
 & & & \pi_1 &
 \end{array}$$

Note that σ_3 is right Kan extended from the full subcategory $\mathcal{K}_1 \subseteq \mathcal{K}_3$. Consequently, an object of \mathcal{C} is a limit of the diagram σ_1 if and only if it is a limit of the diagram σ_3 (Remark 7.3.8.15).

- Let \mathcal{K}_4 denote the full subcategory of \mathcal{K} spanned by the objects x', y, y' , and z' . Note that the functor σ_3 is right Kan extended from \mathcal{K}_4 . It follows that an object of \mathcal{C} is a limit of the functor σ_3 if and only if it is a limit of the functor $\sigma_4 = \sigma_3|_{\mathcal{K}_4}$.

- Let \mathcal{K}_5 denote the full subcategory of \mathcal{K} spanned by the objects y , y' , and z' . Using the criterion of Theorem 7.2.3.1, we see that the inclusion $\mathcal{K}_5 \hookrightarrow \mathcal{K}_4$ is left cofinal. It follows that an object of \mathcal{C} is a limit of the diagram σ_4 if and only if it is a limit of the diagram $\sigma_5 = \sigma_4|_{\mathcal{K}_5}$ (Corollary 7.2.2.11).

Combining these steps, we deduce that an object of \mathcal{C} is an equalizer of f_0 and f_1 if and only if it is a limit of the diagram σ_5 : that is, if and only if it is a fiber product of Y with X over $X \times X$ (along the morphisms (f_0, f_1) and δ_X). \square

In an ∞ -category which admits finite products, we can use a similar argument to describe pullbacks in terms of equalizers.

Proposition 7.6.5.23 (Rewriting Pullbacks as Equalizers). *Let \mathcal{C} be an ∞ -category and let 03HD $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ be morphisms of \mathcal{C} . Suppose that X_0 and X_1 admit a product $X_0 \times X_1$, and let $\pi_0 : X_0 \times X_1 \rightarrow X_0$ and $\pi_1 : X_0 \times X_1 \rightarrow X_1$ denote the projection maps. For $i \in \{0, 1\}$, let $g_i : X_0 \times X_1 \rightarrow X$ denote a composition of π_i with f_i in the ∞ -category \mathcal{C} . Then an object of \mathcal{C} is a pullback of X_0 with X_1 over X if and only if it is an equalizer of the pair of morphisms (g_0, g_1) .*

Proof. Let \mathcal{K} denote the category which is freely generated by a non-commutative square, as indicated in the diagram

$$\begin{array}{ccc} Y_{01} & \xrightarrow{\quad} & Y_0 \\ \downarrow & \searrow & \downarrow \\ Y_1 & \xrightarrow{\quad} & Y. \end{array}$$

Note that the upper right and lower left regions of this diagram determine monomorphisms $\tau_0, \tau_1 : \Delta^2 \hookrightarrow N_\bullet(\mathcal{K})$. The images of τ_0 and τ_1 are simplicial subsets of $N_\bullet(\mathcal{K})$, whose union is $N_\bullet(\mathcal{K})$ and whose intersection is the discrete simplicial set $\{Y_{01}, Y\}$. It follows that τ_0 and τ_1 induce an isomorphism of simplicial sets $(\tau_0, \tau_1) : \Delta^2 \coprod_{\{0,2\}} \Delta^2 \simeq N_\bullet(\mathcal{K})$.

For $i \in \{0, 1\}$, let σ_i be a 2-simplex of \mathcal{C} which witnesses g_i as a composition of π_i with f_i (in the sense of Definition 1.3.4.1). Then there is a unique morphism of simplicial sets

$q : N_\bullet(\mathcal{K}) \rightarrow \mathcal{C}$ satisfying $q \circ \tau_i = \sigma_i$, which we indicate as a diagram

$$\begin{array}{ccccc}
 X_0 \times X_1 & \xrightarrow{\pi_0} & X_0 & & \\
 \downarrow \pi_1 & \searrow g_0 & \downarrow f_0 & & \\
 X_1 & \xrightarrow{f_1} & X. & &
 \end{array}$$

Let $\mathcal{K}_+ \subseteq \mathcal{K}$ denote the full subcategory spanned by the objects Y_{01} and Y . Then the nerve $N_\bullet(\mathcal{K}_+)$ can be identified with the simplicial set $(\bullet \rightrightarrows \bullet)$ of Notation 7.6.5.1, and the restriction $q_+ = q|_{N_\bullet(\mathcal{K}_+)}$ corresponds to the pair of morphisms $g_0, g_1 : X_0 \times X_1 \rightarrow X$. Note that the full subcategory $N_\bullet(\mathcal{K}_+) \subset N_\bullet(\mathcal{K})$ is coreflective, so the inclusion map $N_\bullet(\mathcal{K}_+) \hookrightarrow N_\bullet(\mathcal{K})$ is left cofinal (Corollary 7.2.3.7). It follows that an object of \mathcal{C} is an equalizer of g_0 and g_1 if and only if it is a limit of the diagram q (Corollary 7.2.2.11).

To complete the proof, it will suffice to show that an object of \mathcal{C} is a limit of q if and only if it is a fiber product of X_0 with X_1 over X . Let $\mathcal{K}_- \subseteq \mathcal{K}$ denote the full subcategory spanned by the objects Y_0, Y_1 , and Y . By virtue of Corollaries 7.3.8.2 and 7.3.8.14, it will suffice to show that the functor q is right Kan extended from $N_\bullet(\mathcal{K}_-)$. Equivalently, we wish to show that the natural map

$$N_\bullet(\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/})^\triangleleft \rightarrow N_\bullet(\mathcal{K}) \xrightarrow{q} \mathcal{C}$$

is a limit diagram in \mathcal{C} . Unwinding the definitions, we see that $\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/}$ can be written as a disjoint union of subcategories having initial objects Y_0 and Y_1 , respectively. In particular, the inclusion map

$$\{Y_0, Y_1\} \hookrightarrow N_\bullet(\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/})$$

is left cofinal. The desired result now follows from Corollary 7.2.2.3, together with our assumption that the maps π_0 and π_1 exhibit $X_0 \times X_1$ as a product of X_0 with X_1 . \square

03HE Exercise 7.6.5.24. In the situation of Proposition 7.6.5.23, suppose that X_0 and X_1 admit a fiber product over X . Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which preserves the product of X_0 and X_1 (that is, $F(\pi_0)$ and $F(\pi_1)$ exhibit $F(X_0 \times X_1)$ as a product of $F(X_0)$ with $F(X_1)$ in the ∞ -category \mathcal{D}). Show that F preserves the fiber product of X_0 with X_1 over X if and only if it preserves the equalizer of the morphisms g_0 and g_1 .

03HF Corollary 7.6.5.25. *Let \mathcal{C} be an ∞ -category. Then \mathcal{C} admits finite limits if and only if it admits finite products and equalizers. If these conditions are satisfied, then a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves finite limits if and only if it preserves finite products and equalizers.*

Proof. Combine Corollary 7.6.3.21 with Proposition 7.6.5.23 (and Exercise 7.6.5.24). \square

7.6.6 Sequential Limits and Colimits

Throughout this section, we let $\mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, endowed with its usual ordering.

Definition 7.6.6.1 (Towers). Let \mathcal{C} be an ∞ -category. A *tower* in \mathcal{C} is a functor $N_{\bullet}(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$. We say that \mathcal{C} *admits sequential limits* if every tower in \mathcal{C} has a limit, and that \mathcal{C} *admits sequential colimits* if every diagram $N_{\bullet}(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ has a colimit. We say that a functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ *preserves sequential limits* if it preserves limits indexed by the simplicial set $N_{\bullet}(\mathbf{Z}_{\geq 0}^{\text{op}})$, and that it *preserves sequential colimits* if it preserves colimits indexed by the simplicial set $N_{\bullet}(\mathbf{Z}_{\geq 0})$.

Notation 7.6.6.2. Let \mathcal{C} be an ∞ -category. We will generally abuse notation by identifying a functor $X : N_{\bullet}(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ with the collection of objects $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n+1) \rightarrow X(n)$ obtained by evaluating X on the edges of $N_{\bullet}(\mathbf{Z}_{\geq 0})$ corresponding to ordered pairs of the form $(n, n+1)$; we will depict the pair $(\{X(n)\}_{n \geq 0}, \{f_n\}_{n \geq 0})$ as a diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \dots$$

Similarly, we abuse notation by identifying towers $X : N_{\bullet}(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$ with diagrams

$$\dots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

Beware that the convention of Notation 7.6.6.2 is slightly abusive: the simplicial set $N_{\bullet}(\mathbf{Z}_{\geq 0})$ has nondegenerate simplices in every dimension, so a functor $X : N_{\bullet}(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ is not literally determined by its underlying diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \dots$$

However, the abuse is essentially harmless:

Remark 7.6.6.3. Let $\text{Spine}[\mathbf{Z}_{\geq 0}]$ denote the simplicial subset of $N_{\bullet}(\mathbf{Z}_{\geq 0})$ whose k -simplices are sequences of nonnegative integers (n_0, n_1, \dots, n_k) satisfying $n_0 \leq n_1 \leq \dots \leq n_k \leq n_0 + 1$. Then $\text{Spine}[\mathbf{Z}_{\geq 0}]$ is a 1-dimensional simplicial set, which corresponds (under the equivalence of Proposition 1.1.5.9) to the directed graph G indicated in the diagram

$$0 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow \dots .$$

Moreover, the linearly ordered set $(\mathbf{Z}_{\geq 0}, \leq)$ can be identified with the path category $\text{Path}[G]$ of Construction 1.2.6.1. It follows that the inclusion map $\text{Spine}[\mathbf{Z}_{\geq 0}] \hookrightarrow N_{\bullet}(\mathbf{Z}_{\geq 0})$ is inner anodyne (Proposition 1.4.7.3).

In particular, for any ∞ -category \mathcal{C} , the restriction map

$$\text{Fun}(N_{\bullet}(\mathbf{Z}_{\geq 0}), \mathcal{C}) \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}_{\geq 0}], \mathcal{C})$$

is a trivial Kan fibration (Theorem 1.4.7.1). Stated more informally, every sequence of composable morphisms

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \dots$$

admits an *essentially unique* extension to a functor $N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$.

03HL **Example 7.6.6.4.** Let \mathcal{C} be a locally Kan simplicial category, and suppose we are given a collection of objects $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n) \rightarrow X(n+1)$ in \mathcal{C} . It follows from Remark 7.6.6.3 that the diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \dots$$

can be extended to a functor $N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow N_\bullet^{\text{hc}}(\mathcal{C})$. In fact, there is a preferred choice of such an extension, which is uniquely determined by the requirement that it factors through the inclusion map $N_\bullet(\mathcal{C}) \hookrightarrow N_\bullet^{\text{hc}}(\mathcal{C})$.

03HM **Remark 7.6.6.5.** Let \mathcal{C} be an ∞ -category, and suppose we are given a tower $X : N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$, which we depict as a diagram

$$\dots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0),$$

having a limit $\varprojlim(X)$. Then, for every object $Y \in \mathcal{C}$, the map of sets

$$\theta : \text{Hom}_{\text{h}\mathcal{C}}(Y, \varprojlim(X)) \rightarrow \varprojlim(\text{Hom}_{\text{h}\mathcal{C}}(Y, X(n)))$$

is surjective. To prove this, suppose we are given a collection of morphisms $g_n : Y \rightarrow X(n)$ satisfying $[f_n] \circ [g_{n+1}] = [g_n]$ in the homotopy category $\text{h}\mathcal{C}$. Then, for each $n \geq 0$, we can choose a 2-simplex σ_n in \mathcal{C} as indicated in the diagram

$$\begin{array}{ccc} & X(n+1) & \\ g_{n+1} \nearrow & & \searrow f_n \\ Y & \xrightarrow{g_n} & X(n). \end{array}$$

Let X_0 denote the restriction of X to the spine $\text{Spine}[\mathbf{Z}_{\geq 0}^{\text{op}}] \subset N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}})$. Then the collection of 2-simplices $\{\sigma_n\}_{n \geq 0}$ determines an extension of X_0 to a diagram $\overline{X}_0 : \text{Spine}[\mathbf{Z}_{\geq 0}^{\text{op}}]^{\triangleleft} \rightarrow \mathcal{C}$ carrying the cone point to the object Y . The isomorphism class of this extension can be identified with a morphism $[g] : Y \rightarrow \varprojlim(X_0) \simeq \varprojlim(X)$ in the homotopy category $\text{h}\mathcal{C}$, which is a preimage of the sequence $\{[g_n]\}_{n \geq 0}$ under the function θ .

Warning 7.6.6.6. In the situation of Remark 7.6.6.5, the map

03HN

$$\theta : \text{Hom}_{\text{h}\mathcal{C}}(Y, \varprojlim(X)) \rightarrow \varprojlim(\text{Hom}_{\text{h}\mathcal{C}}(Y, X(n)))$$

need not be injective. That is, the forgetful functor $\mathcal{C} \rightarrow N_{\bullet}(\text{h}\mathcal{C})$ generally does not preserve sequential limits (or colimits).

Example 7.6.6.7. Fix a prime number p . For every integer $n \geq 0$, let $p^n \mathbf{Z}$ denote the cyclic subgroup of \mathbf{Z} generated by p^n , so that we have a tower of classifying simplicial sets

$$\dots \longrightarrow B_{\bullet}(p^3 \mathbf{Z}) \longrightarrow B_{\bullet}(p^2 \mathbf{Z}) \longrightarrow B_{\bullet}(p \mathbf{Z}) \longrightarrow B_{\bullet}(\mathbf{Z}). \quad (7.63) \quad 03HQ$$

Then:

- The tower (7.63) has a limit in the ordinary category of simplicial sets, given by the simplicial set Δ^0 (which we can identify with the classifying simplicial set for the trivial group $(0) = \bigcap_{n \geq 0} p^n \mathbf{Z}$).
- The simplicial set Δ^0 is also a limit of the tower (7.63) in the homotopy category hKan .
- In the ∞ -category \mathcal{S} , the tower (7.63) has a different limit, which has uncountably many connected components (see Remark [?]).

We now give some easy examples of sequential limits and colimits.

Example 7.6.6.8 (Sequential Colimits in \mathcal{QC}). Suppose we are given a collection of ∞ -categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n) \rightarrow \mathcal{C}(n+1)$, which we view as a diagram

$$\mathcal{C}(0) \xrightarrow{F_0} \mathcal{C}(1) \xrightarrow{F_1} \mathcal{C}(2) \xrightarrow{F_2} \mathcal{C}(3) \rightarrow \dots$$

Let $\varinjlim_n \mathcal{C}(n)$ denote the colimit of this diagram (formed in the ordinary category of simplicial sets). Then $\varinjlim_n \mathcal{C}(n)$ is also an ∞ -category, which is also a colimit of the associated diagram $N_{\bullet}(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{QC}$. This is a special case of Corollary 7.5.9.3.

Variant 7.6.6.9 (Sequential Colimits in \mathcal{S}). Suppose we are given a collection of Kan complexes $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n) \rightarrow X(n+1)$, which we view as a diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \rightarrow \dots$$

Let $\varinjlim_n X(n)$ denote the colimit of this diagram (formed in the ordinary category of simplicial sets). Then $\varinjlim_n X(n)$ is also a Kan complex, which is also a colimit of the associated diagram $N_{\bullet}(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{S}$. See Variant 7.5.9.4.

03HT **Example 7.6.6.10** (Towers of Isofibrations). Suppose we are given a collection of ∞ -categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n+1) \rightarrow \mathcal{C}(n)$, which we view as a tower

$$\cdots \rightarrow \mathcal{C}(4) \xrightarrow{F_3} \mathcal{C}(3) \xrightarrow{F_2} \mathcal{C}(2) \xrightarrow{F_1} \mathcal{C}(1) \xrightarrow{F_0} \mathcal{C}(0)$$

If each of the functors F_n is an isofibration, then the limit $\varprojlim_n \mathcal{C}(n)$ (formed in the ordinary category of simplicial sets) is also an ∞ -category, which can be also be viewed as a limit of the associated tower $N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{QC}$. This follows by combining Example 4.5.6.7, Example 7.5.5.3, and Proposition 7.5.5.7.

03HU **Variant 7.6.6.11** (Towers of Kan Fibrations). Suppose we are given a collection of Kan complexes $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n+1) \rightarrow X(n)$, which we view as a tower

$$\cdots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

If each of the morphisms f_n is a Kan fibration, then the limit $\varprojlim_n X(n)$ (formed in the ordinary category of simplicial sets) is also a Kan complex, which can be also be viewed as a limit of the associated tower $N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{S}$ (combine Example 7.6.6.10 with Proposition 7.4.5.1).

03HV **Variant 7.6.6.12** (Limits of General Towers). Suppose we are given a sequence of ∞ -categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n+1) \rightarrow \mathcal{C}(n)$, which we view as a tower

$$03HW \quad \cdots \rightarrow \mathcal{C}(4) \xrightarrow{F_3} \mathcal{C}(3) \xrightarrow{F_2} \mathcal{C}(2) \xrightarrow{F_1} \mathcal{C}(1) \xrightarrow{F_0} \mathcal{C}(0) \tag{7.64}$$

If the functors F_n are not assumed to be isofibrations, then the limit $\varprojlim_n \mathcal{C}(n)$ (formed in the ordinary category of simplicial sets) might not be a limit of the associated tower in \mathcal{QC} (for example, $\varprojlim_n \mathcal{C}(n)$ might fail to be an ∞ -category). Nevertheless, we can always compute the relevant limit in \mathcal{QC} by replacing (7.64) by a levelwise equivalent diagram of ∞ -categories in which the transition functors are isofibrations. For example, we can replace (7.64) by the isofibrant tower of iterated homotopy fiber products

$$\cdots \rightarrow \mathcal{C}(2) \times_{\mathcal{C}(1)}^h (\mathcal{C}(1) \times_{\mathcal{C}(0)}^h \mathcal{C}(0)) \rightarrow \mathcal{C}(1) \times_{\mathcal{C}(0)}^h \mathcal{C}(0) \rightarrow \mathcal{C}(0).$$

Let us denote the limit of this tower (in the category of simplicial sets) by

$$\cdots \times_{\mathcal{C}(3)}^h \mathcal{C}(3) \times_{\mathcal{C}(2)}^h \mathcal{C}(2) \times_{\mathcal{C}(1)}^h \mathcal{C}(1) \times_{\mathcal{C}(0)}^h \mathcal{C}(0).$$

It is an ∞ -category whose objects can be identified with sequences of pairs $\{(C_n, \alpha_n)\}_{n \geq 0}$, where each C_n is an object of the ∞ -category $\mathcal{C}(n)$ and each $\alpha_n : F_n(C_{n+1}) \xrightarrow{\sim} C_n$ is an isomorphism in the ∞ -category $\mathcal{C}(n)$. Combining Example 7.6.6.10 with Remark 7.1.1.8, we see that it can be identified with a limit of the diagram (7.64) in the ∞ -category \mathcal{QC} .

Sequential limits are useful for building more complicated types of limits.

Proposition 7.6.6.13. *Suppose we are given a diagram of simplicial sets*

03HX

$$K(0) \rightarrow K(1) \rightarrow K(2) \rightarrow K(3) \rightarrow \dots$$

having colimit K . Let \mathcal{C} be an ∞ -category and let $f : K \rightarrow \mathcal{C}$ be a diagram, corresponding to a compatible sequence of diagrams $f_n : K(n) \rightarrow \mathcal{C}$. Suppose that each of the diagrams f_n admits a limit in \mathcal{C} . Then there exists a tower $X : N_{\bullet}(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$ with the following properties:

- (1) For each $n \geq 0$, the object $X(n) \in \mathcal{C}$ is a limit of the diagram f_n .
- (2) An object of \mathcal{C} is a limit of the diagram f if and only if it is a limit of the tower X . In particular, the diagram f has a limit if and only if the tower X has a limit.
- (3) Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which preserves the limits of each of the diagrams f_n . Then F preserves limits of the diagram f if and only if it preserves limits of the tower X .

Proof. Combine Propositions 7.5.8.12 and 7.5.9.1. □

Corollary 7.6.6.14. *Suppose we are given a diagram of simplicial sets*

03HY

$$K(0) \rightarrow K(1) \rightarrow K(2) \rightarrow K(3) \rightarrow \dots$$

having colimit K , and let \mathcal{C} be an ∞ -category which admits sequential limits and $K(n)$ -indexed limits, for each $n \geq 0$. Then \mathcal{C} admits K -indexed colimits. If $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories which preserves sequential limits and $K(n)$ -indexed limits for each $n \geq 0$, then it also preserves K -indexed limits.

Example 7.6.6.15. Let \mathcal{C} be an ∞ -category which admits finite products. If \mathcal{C} admits sequential limits, then it also admits countable products. More precisely, for any countable collection of objects $\{X_n\}_{n \geq 0}$ of \mathcal{C} , the product $\prod_{n \geq 0} X_n$ can be computed as the limit of a tower

$$\dots \rightarrow X_2 \times X_1 \times X_0 \rightarrow X_1 \times X_0 \rightarrow X_0.$$

We now establish a partial converse to Example 7.6.6.15. Let \mathcal{C} be an ∞ -category which admits countable products, and suppose that we are given a tower

$$\dots \rightarrow X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0)$$

in \mathcal{C} . Then the collection of morphisms $\{f_n\}_{n \geq 0}$ determine an endomorphism f of the product $P = \prod_{n \geq 0} X(n)$, given informally by the composition

$$\begin{aligned} P &= \prod_{n \geq 0} X(n) \\ &\rightarrow \prod_{n > 0} X(n) \\ &= \prod_{m \geq 0} X(m+1) \\ &\xrightarrow{\prod_{m \geq 0} f_m} \prod_{m \geq 0} X(m) \\ &= P. \end{aligned}$$

In this case, we can identify limits of the tower X with equalizers of the pair of morphisms $f, \text{id}_P : P \rightarrow P$. We can formulate this assertion more precisely as follows:

03J0 **Proposition 7.6.6.16** (Sequential Limits as Equalizers). *Let \mathcal{C} be an ∞ -category and let $X : N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$ be a tower, which we identify with the diagram*

$$\cdots \rightarrow X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

Suppose that there exists an object $P \in \mathcal{C}$ equipped with morphisms $\{q_n : P \rightarrow X(n)\}_{n \geq 0}$ which exhibits P as a product of the collection $\{X(n)\}_{n \geq 0}$. Then:

- (1) *There exists a morphism $f : P \rightarrow P$ with the property that, for each $n \geq 0$, the diagram*

03J1

$$\begin{array}{ccc} P & \xrightarrow{[f]} & P \\ \downarrow [q_{n+1}] & & \downarrow [q_n] \\ X(n+1) & \xrightarrow{[f_n]} & X(n) \end{array} \tag{7.65}$$

commutes in the homotopy category $\text{h}\mathcal{C}$. Moreover, the morphism f is uniquely determined up to homotopy.

- (2) *An object of \mathcal{C} is a limit of the tower X if and only if it is an equalizer of the pair of morphisms $f, \text{id}_P : P \rightarrow P$.*

Proof. Assertion (1) follows immediately from the definitions (see Warning 7.6.1.11). To prove (2), let $M = \mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, which we regard as a commutative monoid with respect to addition. Let BM denote the associated category

(consisting of a single object E having endomorphism monoid $\text{Hom}_{BM}(E, E) = M$) and let $B_\bullet M$ denote the nerve of BM (see Example 1.2.4.3). There is a functor of ordinary categories $(\mathbf{Z}_{\geq 0}, \leq)^{\text{op}} \rightarrow BM$ which is characterized by the requirement that, for every pair of nonnegative integers $m \leq n$, the induced map

$$\text{Hom}_{\mathbf{Z}_{\geq 0}}(m, n) \rightarrow \text{Hom}_{BM}(E, E) = M$$

carries the unique element of $\text{Hom}_{\mathbf{Z}_{\geq 0}}(m, n)$ to the difference $n - m \in M$. Passing to nerves, we obtain a functor of ∞ -categories $U : N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow B_\bullet M$. The functor U is a cartesian fibration, whose fiber over the vertex $E \in B_\bullet M$ can be identified with the discrete simplicial set $\{0, 1, 2, \dots\}$. Applying Corollary 7.3.4.8, we deduce that there exists a functor $Y : B_\bullet M \rightarrow \mathcal{C}$ and a natural transformation $\alpha : Y \circ U \rightarrow X$ which exhibits Y as a right Kan extension of X along U .

For every nonnegative integer n , α induces a morphism $\alpha_n : Y(E) \rightarrow X(n)$ in the ∞ -category \mathcal{C} . Using the criterion of Proposition 7.3.4.1, we see that the collection of morphisms $\{\alpha_n\}_{n \geq 0}$ exhibit $Y(E)$ as a product of the collection of objects $\{X(n)\}_{n \geq 0}$. We may therefore assume without loss of generality that $P = Y(E)$ and $q_n = \alpha_n$, for each $n \geq 0$. Let $f : P \rightarrow P$ be the morphism obtained by evaluating the functor Y on the generator $1 \in M$. For each $n \geq 0$, the natural transformation α carries the edge $n + 1 \rightarrow n$ of $N_\bullet(\mathbf{Z}_{\geq 0})$ to a commutative diagram

$$\begin{array}{ccc} P & \xrightarrow{f} & P \\ \downarrow q_{n+1} & & \downarrow q_n \\ X(n+1) & \xrightarrow{f_n} & X(n) \end{array}$$

in the ∞ -category \mathcal{C} , which witnesses the commutativity of the diagram (7.65) in the homotopy category $\text{h}\mathcal{C}$. Moreover, an object $C \in \mathcal{C}$ is an equalizer of the pair of morphisms $f, \text{id}_P : P \rightarrow P$ if and only if it is a limit of the diagram Y (Variant 7.6.5.9). To prove (2), it suffices to observe that this is equivalent to the requirement that C is a limit of the tower X , which follows from Corollary 7.3.8.20. \square

Remark 7.6.6.17. In the situation of Proposition 7.6.6.16, suppose that $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories which preserves the product of the collection $\{X(n)\}_{n \geq 0}$. Then F preserves limits of the tower X if and only if it preserves equalizers of the pair of morphisms $f, \text{id}_P : P \rightarrow P$.

7.6.7 Small Limits

We now study limits and colimits indexed by diagrams of bounded size.

03UC

03UD **Definition 7.6.7.1.** Let κ be an infinite cardinal and let \mathcal{C} be an ∞ -category. We say that \mathcal{C} is κ -complete if admits K -indexed limits, for every κ -small simplicial set K .

We say that a functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves κ -small limits if it preserves K -indexed limits, for every κ -small simplicial set K (Definition 7.1.3.4).

03UE **Remark 7.6.7.2.** Let \mathcal{C} be an ∞ -category and let λ be an infinite cardinal. If \mathcal{C} is λ -complete, then it is also κ -complete for each infinite cardinal $\kappa < \lambda$. Similarly, if a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves λ -small limits, then it also preserves κ -small limits for each $\kappa < \lambda$. In both cases, the converse holds if λ is an uncountable limit cardinal (since, in that case, every λ -small simplicial set K is κ -small for some $\kappa < \lambda$).

03UF **Example 7.6.7.3.** An ∞ -category \mathcal{C} is \aleph_0 -complete if and only if it admits finite limits. Similarly, a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves \aleph_0 -small limits if and only if it preserves finite limits.

03UG **Example 7.6.7.4.** Let λ be an uncountable regular cardinal and let $\kappa = \text{ecf}(\lambda)$ be its exponential cofinality (Definition 5.4.3.16). Let $\mathcal{S}^{<\lambda}$ denote the ∞ -category of λ -small spaces (Variant 5.6.4.12) and let $\mathcal{QC}^{<\lambda}$ denote the ∞ -category of λ -small ∞ -categories (Variant 5.6.4.10). Then the ∞ -categories $\mathcal{S}^{<\lambda}$ and $\mathcal{QC}^{<\lambda}$ are κ -complete. Moreover, the inclusion maps

$$\mathcal{S}^{<\lambda} \hookrightarrow \mathcal{S} \quad \mathcal{QC}^{<\lambda} \hookrightarrow \mathcal{QC}$$

preserve κ -small limits. See Corollary 7.4.1.12 and Variant 7.4.5.8. In particular, if $\kappa = \lambda$ is a strongly inaccessible cardinal, then the ∞ -categories $\mathcal{S}^{<\kappa}$ and $\mathcal{QC}^{<\kappa}$ are κ -complete.

048G **Remark 7.6.7.5.** Let \mathcal{C} be an ∞ -category which is κ -complete for some infinite cardinal κ . Then, for every simplicial set K , the ∞ -category $\text{Fun}(K, \mathcal{C})$ is also κ -complete. See Corollary 7.1.6.2.

03UH **Remark 7.6.7.6.** Let κ be an uncountable cardinal and let \mathcal{C} be an ∞ -category. The following conditions are equivalent:

- The ∞ -category \mathcal{C} is κ -complete: that is, it admits K -indexed limits for every κ -small simplicial set K .
- The ∞ -category \mathcal{C} admits K -indexed limits, for every simplicial set K which is essentially κ -small.

Moreover, in either case, it suffices to consider the case where K is an ∞ -category. See Remark 7.1.1.16 and Proposition 5.4.5.5. Similarly, a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves κ -small limits if and only if it preserves K -indexed limits, for every simplicial set K which is essentially κ -small (and it again suffices to consider the case where K is an ∞ -category).

Variant 7.6.7.7. Let κ be an infinite cardinal. We say that an ∞ -category \mathcal{C} is κ -cocomplete 03UJ if it admits K -indexed colimits, for every κ -small simplicial set K . Equivalently, the ∞ -category \mathcal{C} is κ -cocomplete if the opposite ∞ -category \mathcal{C}^{op} is κ -complete.

We say that a functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves κ -small colimits if it preserves K -indexed colimits, for every κ -small simplicial set K . Equivalently, F preserves κ -small colimits if the opposite functor $F^{\text{op}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{D}^{\text{op}}$ preserves κ -small limits.

Example 7.6.7.8. Let λ be an uncountable regular cardinal and let $\kappa = \text{cf}(\lambda)$ denote its 03UK cofinality. Then the ∞ -categories $\mathcal{S}^{<\lambda}$ and $\mathcal{QC}^{<\lambda}$ are κ -complete. Moreover, the inclusion maps

$$\mathcal{S}^{<\lambda} \hookrightarrow \mathcal{S} \quad \mathcal{QC}^{<\lambda} \hookrightarrow \mathcal{QC}$$

preserve κ -small colimits. See Corollary 7.4.3.15 and Remark 7.4.5.7. In particular, if $\kappa = \lambda$ is an uncountable regular cardinal, then the ∞ -categories $\mathcal{S}^{<\kappa}$ and $\mathcal{QC}^{<\kappa}$ are κ -complete.

Proposition 7.6.7.9. Let \mathcal{C} be an ∞ -category and let κ be an infinite cardinal. Then \mathcal{C} is 03UL κ -complete if and only if it satisfies the following conditions:

- (1) The ∞ -category \mathcal{C} admits κ -small products. That is, every collection of objects $\{X_j\}_{j \in J}$ indexed by a κ -small set J admits a product in \mathcal{C} .
- (2) The ∞ -category \mathcal{C} admits finite limits.

Proof. Assume that \mathcal{C} satisfies conditions (1) and (2); we wish to show that \mathcal{C} is κ -complete (the converse is immediate from the definitions). Let S be a κ -small simplicial set; we wish to show that \mathcal{C} admits S -indexed limits. If $\kappa = \aleph_0$, this follows immediately from assumption (2) (Example 7.6.7.3). We may therefore assume that κ is uncountable, so that \mathcal{C} admits countable products.

For each $n \geq 0$, let $\text{sk}_n(S)$ denote the n -skeleton of S (Construction 1.1.3.5), so that $S = \bigcup_n \text{sk}_n(S)$. It follows from Proposition 7.6.6.16 that \mathcal{C} admits sequential limits. Consequently, to show that \mathcal{C} admits S -indexed limits, it will suffice to show that it admits $\text{sk}_n(S)$ -indexed limits, for each $n \geq 0$ (Corollary 7.6.6.14). We may therefore assume without loss of generality that the simplicial set S has finite dimension. We proceed by induction on the dimension n of S . If $n = -1$, then S is empty and the desired result is immediate. Assume that $n \geq 0$ and let $\{\sigma_j\}_{j \in J}$ denote the collection of nondegenerate n -simplices of S , so that Proposition 1.1.3.13 supplies a pushout diagram of simplicial sets

$$\begin{array}{ccc} \coprod_{j \in J} \partial\Delta^n & \longrightarrow & \coprod_{j \in J} \Delta^n \\ \downarrow & & \downarrow \\ \text{sk}_{n-1}(S) & \longrightarrow & \text{sk}_n(S). \end{array}$$

Since the horizontal maps in this diagram are monomorphisms, it is also a categorical pushout square (Example 4.5.4.12). By virtue of Proposition 7.6.3.20, it will suffice to show that \mathcal{C} admits limits indexed by the simplicial sets $\text{sk}_{n-1}(S)$, $J \times \partial\Delta^n$, and $J \times \Delta^n$. In the first two cases, this follows from our inductive hypothesis. To handle the third case, we can use assumption (1) and Corollary 7.6.1.19 to reduce to showing that the ∞ -category \mathcal{C} admits Δ^n -indexed limits. This is clear, since the simplicial set Δ^n is an ∞ -category containing an initial object (see Corollary 7.2.2.12). \square

03UM **Remark 7.6.7.10.** In the situation of Proposition 7.6.7.9, we can replace (2) by either of the following *a priori* weaker conditions:

- (2') The ∞ -category \mathcal{C} admits pullbacks.
- (2'') The ∞ -category \mathcal{C} admits equalizers.

See Corollary 7.6.3.21 and 7.6.5.25.

03J4 **Exercise 7.6.7.11.** Let κ be an infinite cardinal, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and suppose that \mathcal{C} is κ -complete. Show that F preserves κ -small limits if and only if it preserves finite limits and κ -small products.

03UN **Corollary 7.6.7.12.** *Let \mathcal{C} be an ∞ -category and let λ be an infinite cardinal which is not regular. The following conditions are equivalent:*

- (1) *The ∞ -category \mathcal{C} is λ -complete.*
- (2) *For every infinite cardinal $\kappa < \lambda$, the ∞ -category \mathcal{C} is κ -complete.*
- (3) *The ∞ -category \mathcal{C} is λ^+ -complete, where λ^+ denotes the successor cardinal of λ .*

By virtue of Corollary 7.6.7.12, little information is lost by restricting the use of Definition 7.6.7.1 to the case where κ is a regular cardinal.

Proof of Corollary 7.6.7.12. The equivalence (1) \Leftrightarrow (2) and the implication (3) \Rightarrow (1) follow from Remark 7.6.7.2. We will complete the proof by showing that (1) implies (3). Assume that \mathcal{C} is λ -complete; we wish to show that it is λ^+ -complete. By virtue of Proposition 7.6.7.9, it will suffice to show that every collection of objects $\{X_i\}_{i \in I}$ admits a product in \mathcal{C} , provided that the index set I has cardinality $\leq \lambda$. Our assumption that λ is not regular guarantees that we can decompose I as a disjoint union of λ -small subsets $\{I_j \subseteq I\}_{j \in J}$, where the index set J is λ -small. It follows from (1) that \mathcal{C} admits J -indexed products and also that it admits I_j -indexed products for each $j \in J$, and therefore admits I -indexed products by virtue of Corollary 7.6.1.19. \square

The existence of κ -small limits can be used to prove the existence of a large class of Kan extensions.

Proposition 7.6.7.13. *Let κ be an uncountable regular cardinal and let K be a simplicial set which is essentially κ -small. Suppose we are given a pair of ∞ -categories \mathcal{C} and \mathcal{D} , together with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$. Suppose that \mathcal{C} is locally κ -small and that \mathcal{D} is κ -complete. Then F_0 admits a right Kan extension along δ .*

Proof. By virtue of Proposition 7.3.5.1, it will suffice to show that for every object $C \in \mathcal{C}$, the composite map

$$K \times_{\mathcal{C}} \mathcal{C}_{C/} \rightarrow K \xrightarrow{F_0} \mathcal{D}$$

admits a limit in the ∞ -category \mathcal{D} . Note that the projection map $K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is a left fibration of simplicial sets (Proposition 4.3.6.1), whose fiber over each vertex $x \in K$ can be identified with the Kan complex $\text{Hom}_{\mathcal{C}}^L(C, \delta(x))$. Invoking Proposition 4.6.5.9, we see that $\text{Hom}_{\mathcal{C}}^L(C, \delta(x))$ is homotopy equivalent to the morphism space $\text{Hom}_{\mathcal{C}}(C, \delta(x))$, and is therefore essentially κ -small (by virtue of our assumption that \mathcal{C} is locally κ -small). Since K is essentially κ -small, Corollary 5.4.9.16 implies that the simplicial set $K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is essentially κ -small. The desired result now follows from our assumption that \mathcal{D} is κ -complete (Remark 7.6.7.6). \square

Chapter 8

The Yoneda Embedding

03JA 8.1 Twisted Arrows and Cospans

03JB Let \mathcal{C} be an ∞ -category. In §4.6.1, we associated to every pair of objects $X, Y \in \mathcal{C}$ a Kan complex $\text{Hom}_{\mathcal{C}}(X, Y)$, whose vertices are morphisms from X to Y . In §8.3.3, we will see that the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ can be refined to a functor of ∞ -categories

$$\text{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S} = N_{\bullet}^{\text{hc}}(\text{Kan}).$$

It is somewhat cumbersome to give an explicit description of this functor. It will therefore be more convenient to specify it *implicitly* by realizing it as the covariant transport representation of a left fibration over $\mathcal{C}^{\text{op}} \times \mathcal{C}$. We begin by discussing the counterpart of this fibration in the setting of classical category theory.

00AZ **Construction 8.1.0.1** (The Twisted Arrow Category). Let \mathcal{C} be a category. We define a new category $\text{Tw}(\mathcal{C})$ as follows:

- An object of $\text{Tw}(\mathcal{C})$ is a morphism $f : X \rightarrow Y$ in \mathcal{C} .
- Let $f : X \rightarrow Y$ and $f' : X' \rightarrow Y'$ be objects of $\text{Tw}(\mathcal{C})$. A morphism from f to f' in $\text{Tw}(\mathcal{C})$ is a pair of morphisms $u : X' \rightarrow X$, $v : Y \rightarrow Y'$ in \mathcal{C} satisfying $f' = v \circ f \circ u$, so that we have a commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{u} & X' \\ \downarrow f & & \downarrow f' \\ Y & \xrightarrow{v} & Y'. \end{array}$$

- Let $f : X \rightarrow Y$, $f' : X' \rightarrow Y'$, and $f'' : X'' \rightarrow Y''$ be objects of $\text{Tw}(\mathcal{C})$. If (u, v) is a morphism from f to f' in $\text{Tw}(\mathcal{C})$ and (u', v') is a morphism from f' to f'' in \mathcal{C} , then the composition $(u', v') \circ (u, v)$ in $\text{Tw}(\mathcal{C})$ is the pair $(u \circ u', v' \circ v)$.

We will refer to $\text{Tw}(\mathcal{C})$ as the *twisted arrow category* of \mathcal{C} .

Remark 8.1.0.2. Let \mathcal{C} be a category. Then the construction $(f : X \rightarrow Y) \mapsto (X, Y)$ 00B1 determines a forgetful functor $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$. Moreover, λ is a left covering functor, in the sense of Definition 4.2.3.1.

Remark 8.1.0.3 ($\text{Tw}(\mathcal{C})$ as a Category of Elements). Let \mathcal{C} be a category. Then the 03JC construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ determines a functor $\text{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \text{Set}$. The twisted arrow category $\text{Tw}(\mathcal{C})$ of Construction 8.1.0.1 can be identified with the category of elements $\int_{\mathcal{C}^{\text{op}} \times \mathcal{C}} \text{Hom}_{\mathcal{C}}(\bullet, \bullet)$ (see Construction 5.2.6.1).

It follows that the functor $\text{Hom}_{\mathcal{C}}(\bullet, \bullet)$ is determined (up to canonical isomorphism) by the datum of the twisted arrow category $\text{Tw}(\mathcal{C})$ together with the forgetful functor $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Remark 8.1.0.2 (see Corollary 5.2.7.5).

Warning 8.1.0.4 (Untwisted Arrow Categories). Let $[1] = \{0 < 1\}$ denote a linearly ordered 03JD set with two elements. For any category \mathcal{C} , we can identify morphisms of \mathcal{C} with functors $F : [1] \rightarrow \mathcal{C}$. The collection of such functors can be organized into a category $\text{Fun}([1], \mathcal{C})$, which we refer to as the *arrow category* of \mathcal{C} . The arrow category $\text{Fun}([1], \mathcal{C})$ has the same objects as the twisted arrow category $\text{Tw}(\mathcal{C})$. However, the morphisms are different: if $f : X \rightarrow Y$ and $f' : X' \rightarrow Y'$ are morphisms of \mathcal{C} , then morphisms from f to f' in $\text{Fun}([1], \mathcal{C})$ can be identified with commutative diagrams

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow f & & \downarrow f' \\ Y & \longrightarrow & Y', \end{array}$$

where the horizontal maps are oriented in the same direction.

Example 8.1.0.5. Let Q be a partially ordered set, which we regard as a category. Then 00B2 the twisted arrow category $\text{Tw}(Q)$ can be identified (via the forgetful functor of Remark 8.1.0.2) with the partially ordered set

$$\{(p, q) \in Q^{\text{op}} \times Q : p \leq q\} \subseteq Q^{\text{op}} \times Q.$$

Remark 8.1.0.6. Let \mathcal{C} be a category. For every object $X \in \mathcal{C}$, the fiber $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ 03JE can be identified with the coslice category $\mathcal{C}_{X/}$ of Variant 4.3.1.4. Similarly, the fiber $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{X\}$ can be identified with the *opposite* of the slice category $\mathcal{C}_{/X}$ of Construction 4.3.1.1.

In §8.1.1, we generalize Construction 8.1.0.1 to the setting of ∞ -categories. To every simplicial set \mathcal{C} , we associate another simplicial set $\text{Tw}(\mathcal{C})$, whose n -simplices can be identified with $(2n + 1)$ -simplices of \mathcal{C} (Construction 8.1.1.1). This construction has the following features:

- If $\mathcal{C} = N_\bullet(\mathcal{C}_0)$ is (the nerve of) an ordinary category \mathcal{C}_0 , then $\text{Tw}(\mathcal{C})$ can be identified with the nerve of the twisted arrow category $\text{Tw}(\mathcal{C}_0)$ (Proposition 8.1.1.10). Consequently, the twisted arrow construction of §8.1.1 can be regarded as a generalization of Construction 8.1.0.1.
- The simplicial set $\text{Tw}(\mathcal{C})$ is equipped with a projection map $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$. If \mathcal{C} is an ∞ -category, then λ is a left fibration (Proposition 8.1.1.11); in particular, $\text{Tw}(\mathcal{C})$ is also an ∞ -category (Corollary 8.1.1.12).

Let \mathcal{C} be an ∞ -category. In §8.1.2, we study the fibers of the left fibration $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$. Our main result asserts that if $f : X \rightarrow Y$ is an isomorphism in the ∞ -category \mathcal{C} , then f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (see Proposition 8.1.2.1, and Corollary 8.1.2.21 for the converse). From this, we deduce an analogue of Remark 8.1.0.6: there is a canonical equivalence of ∞ -categories $\mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (Proposition 8.1.2.9), which induces a homotopy equivalence of Kan complexes

$$\text{Hom}_{\mathcal{C}}(X, Y) \simeq \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

for each object $Y \in \mathcal{C}$ (Notation 8.1.2.14). Moreover, we show that these homotopy equivalences are compatible with covariant transport for the left fibration λ (Corollary 8.1.2.18).

The twisted arrow construction $S \mapsto \text{Tw}(S)$ determines a functor from the category of simplicial sets to itself. In particular, to every simplicial set T we can associate a new simplicial set $\text{Cospan}(T)$, whose n -simplices are given by maps $\text{Tw}(\Delta^n) \rightarrow T$. We will refer to $\text{Cospan}(T)$ as the *simplicial set of cospans in T* (Construction 8.1.3.1). This construction has the following features:

- The construction $T \mapsto \text{Cospan}(T)$ determines a functor from the category of simplicial sets to itself, which is right adjoint to the twisted arrow functor $S \mapsto \text{Tw}(S)$ (Corollary 8.1.3.8).
- Let \mathcal{C} be an ordinary category which admits pushouts, and let $\text{Cospan}(\mathcal{C})$ denote the 2-category of cospans in \mathcal{C} (Example 2.2.2.1). Then there is a canonical isomorphism of simplicial sets

$$\text{Cospan}(N_\bullet(\mathcal{C})) \xrightarrow{\sim} N_\bullet^D(\text{Cospan}(\mathcal{C})),$$

which we construct in §8.1.3 (see Corollary 8.1.3.15).

- Let \mathcal{C} be a 2-category containing a pair of objects X and Y , and let $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ denote the category of 1-morphisms from X to Y . Then there is a canonical isomorphism of simplicial sets

$$\text{Cospan}(\mathbf{N}_{\bullet}\underline{\text{Hom}}_{\mathcal{C}}(X, Y)) \xrightarrow{\sim} \text{Hom}_{\mathbf{N}_{\bullet}^D(\mathcal{C})}(X, Y),$$

which we construct in §8.1.8 (see Corollary 8.1.8.6).

- If \mathcal{C} is an ∞ -category which admits pushouts, then the simplicial set $\text{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category (Proposition 8.1.4.1). We prove this in §8.1.4 using an explicit characterization of the collection of thin 2-simplices of $\text{Cospan}(\mathcal{C})$ (Proposition 8.1.4.2), which we prove in §8.1.5.

8.1.1 The Twisted Arrow Construction

We now describe an ∞ -categorical generalization of Construction 8.1.0.1.

03JF

Construction 8.1.1.1 (Twisted Arrows in Simplicial Sets). Let Δ denote the simplex category (Definition 1.1.1.2) and let \mathcal{C} be a simplicial set. We let $\text{Tw}(\mathcal{C}) : \Delta^{\text{op}} \rightarrow \text{Set}$ denote the functor given by the construction

$$(J \in \Delta^{\text{op}}) \mapsto \text{Hom}_{\text{Set}_{\Delta}}(\mathbf{N}_{\bullet}(J^{\text{op}} \star J), \mathcal{C}).$$

We will refer to $\text{Tw}(\mathcal{C})$ as the *simplicial set of twisted arrows of \mathcal{C}* .

Remark 8.1.1.2. For every integer $n \geq 0$, there is a unique isomorphism of simplicial sets $\mathbf{N}_{\bullet}([n]^{\text{op}} \star [n]) \simeq \Delta^{2n+1}$. It follows that, for every simplicial set \mathcal{C} , we can identify n -simplices σ of $\text{Tw}(\mathcal{C})$ with $(2n+1)$ -simplices $\bar{\sigma}$ of \mathcal{C} . In terms of these identifications, the face and degeneracy operators of $\text{Tw}(\mathcal{C})$ are given explicitly by the formulae

$$\overline{d_i \sigma} = d_{n-i} d_{n+1+i} \bar{\sigma} \quad \overline{s_i \sigma} = s_{n-i} s_{n+1+i} \bar{\sigma}.$$

Remark 8.1.1.3. Let \mathcal{C} be a simplicial set. We will generally use Remark 8.1.1.2 to identify vertices of the simplicial set $\text{Tw}(\mathcal{C})$ with edges $f : X \rightarrow Y$ of \mathcal{C} . More generally, it will be useful to think of n -simplices of $\text{Tw}(\mathcal{C})$ as encoding diagrams

$$\begin{array}{ccccccccc} X_0 & \longleftarrow & X_1 & \longleftarrow & X_2 & \longleftarrow & \cdots & \longleftarrow & X_n \\ \downarrow f_0 & & \downarrow f_1 & & \downarrow f_2 & & & & \downarrow f_n \\ Y_0 & \longrightarrow & Y_1 & \longrightarrow & Y_2 & \longrightarrow & \cdots & \longrightarrow & Y_n. \end{array}$$

Remark 8.1.1.4. The construction $\mathcal{C} \mapsto \text{Tw}(\mathcal{C})$ determines a functor from the category of simplicial sets to itself, which preserves all limits and colimits (this follows from Remark 8.1.1.2, since limits and colimits in the category Set_{Δ} are computed levelwise).

03Y5 **Remark 8.1.1.5.** Let κ be an uncountable cardinal. If \mathcal{C} is a κ -small simplicial set, then $\text{Tw}(\mathcal{C})$ is also κ -small. To prove this, we may assume without loss of generality that κ is the smallest uncountable cardinal for which \mathcal{C} is κ -small. In particular, κ is regular. It will therefore suffice to show that, for every integer n , the set of n -simplices of $\text{Tw}(\mathcal{C})$ is κ -small (Proposition 5.4.4.9). This follows from the κ -smallness of the set of $(2n+1)$ -simplices of \mathcal{C} (Remark 8.1.1.2).

03JK **Notation 8.1.1.6** (Projection Maps). Let \mathcal{C} be a simplicial set. Then the simplicial set $\text{Tw}(\mathcal{C})$ is equipped with projection maps

$$\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \quad \lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}.$$

Here λ_+ carries an n -simplex σ of $\text{Tw}(\mathcal{C})$ to the n -simplex of \mathcal{C} given by the composition

$$\Delta^n = N_{\bullet}([n]) \hookrightarrow N_{\bullet}([n]^{\text{op}} \star [n]) \xrightarrow{\sigma} \mathcal{C},$$

while λ_- carries σ to the n -simplex of \mathcal{C}^{op} given by the composite map

$$(\Delta^n)^{\text{op}} = N_{\bullet}([n]^{\text{op}}) \hookrightarrow N_{\bullet}([n]^{\text{op}} \star [n]) \xrightarrow{\sigma} \mathcal{C}.$$

Concretely, λ_- and λ_+ are given on vertices by the formulae $\lambda_-(f : X \rightarrow Y) = X$ and $\lambda_+(f : X \rightarrow Y) = Y$.

03JL **Remark 8.1.1.7** (Duality). Let \mathcal{C} be a simplicial set. Then there is a canonical isomorphism of simplicial sets $\iota : \text{Tw}(\mathcal{C}) \simeq \text{Tw}(\mathcal{C}^{\text{op}})$, given on n -simplices by precomposition with the unique isomorphism

$$N_{\bullet}([n]^{\text{op}} \star [n])^{\text{op}} \simeq N_{\bullet}([n]^{\text{op}} \star [n]).$$

The isomorphism ι interchanges the projection maps λ_- and λ_+ of Notation 8.1.1.6.

03JM **Exercise 8.1.1.8** (Slices of Twisted Arrows). Let \mathcal{C} be a simplicial set and let $f : X \rightarrow Y$ be an edge of \mathcal{C} , which we regard as a vertex of the simplicial set $\text{Tw}(\mathcal{C})$. Show that there is a canonical isomorphism of simplicial sets

$$\text{Tw}(\mathcal{C})_{/f} \simeq \text{Tw}(\mathcal{C}_{X//Y}).$$

Here $\mathcal{C}_{X//Y}$ denotes the simplicial set $(\mathcal{C}_{X/})_{/Y} \simeq (\mathcal{C}_{/Y})_{X/}$, obtained either by promoting Y to a vertex of $\mathcal{C}_{X/}$ or X to a vertex of $\mathcal{C}_{/Y}$ by means of the edge f .

03LW **Warning 8.1.1.9.** Let \mathcal{C} be a simplicial set. Then there is a tautological map $T : \mathcal{C} \rightarrow \text{Tw}(\mathcal{C}^{\text{op}} \star \mathcal{C})$, which carries an n -simplex $\sigma : \Delta^n \rightarrow \mathcal{C}$ to the n -simplex $T(\sigma)$ of $\text{Tw}(\mathcal{C}^{\text{op}} \star \mathcal{C})$ given by the composition

$$N_{\bullet}([n]^{\text{op}} \star [n]) \xrightarrow{\sigma^{\text{op}} \star \sigma} \mathcal{C}^{\text{op}} \star \mathcal{C}.$$

If \mathcal{D} is another simplicial set, then precomposition with T induces a comparison map

$$\text{Hom}_{\text{Set}_\Delta}(\mathcal{C}^{\text{op}} \star \mathcal{C}, \mathcal{D}) \rightarrow \text{Hom}_{\text{Set}_\Delta}(\text{Tw}(\mathcal{C}^{\text{op}} \star \mathcal{C}), \text{Tw}(\mathcal{D})) \xrightarrow{\circ T} \text{Hom}_{\text{Set}_\Delta}(\mathcal{C}, \text{Tw}(\mathcal{D})).$$

Beware that, in general, this map is not a bijection. However, it is a bijection whenever \mathcal{C} is isomorphic to the nerve of a linearly ordered set Q . To prove this, we can write Q as a filtered colimit of its finite subsets and thereby reduce to the case where Q is finite. In this case, the linearly ordered set Q is either empty (in which case the desired result is obvious) or isomorphic to $[n]$ for some integer $n \geq 0$ (in which case the desired result follows from the definition of the $\text{Tw}(\mathcal{D})$).

We now show that Construction 8.1.1.1 can be regarded as a generalization of Construction 8.1.0.1.

Proposition 8.1.1.10. *Let \mathcal{C} be a category. Then there is a canonical isomorphism of 03JN simplicial sets $T : N_\bullet(\text{Tw}(\mathcal{C})) \xrightarrow{\sim} \text{Tw}(N_\bullet(\mathcal{C}))$, which is uniquely determined by the following requirements:*

- (1) *For every morphism $f : C \rightarrow D$ in the category \mathcal{C} , the map T carries f (regarded as an object of $\text{Tw}(\mathcal{C})$) to itself (regarded as a vertex of $\text{Tw}(N_\bullet(\mathcal{C}))$).*
- (2) *The diagram*

$$\begin{array}{ccc} N_\bullet(\text{Tw}(\mathcal{C})) & \xrightarrow{T} & \text{Tw}(N_\bullet(\mathcal{C})) \\ \downarrow & & \downarrow (\lambda_-, \lambda_+) \\ N_\bullet(\mathcal{C}^{\text{op}} \times \mathcal{C}) & \xrightarrow{\sim} & N_\bullet(\mathcal{C})^{\text{op}} \times N_\bullet(\mathcal{C}) \end{array}$$

commutes, where the right vertical map is given by Notation 8.1.1.6 and the left vertical map is the nerve of the forgetful functor

$$\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C} \quad (f : X \rightarrow Y) \mapsto (X, Y).$$

Proof. Let σ be an n -simplex of the simplicial set $N_\bullet(\text{Tw}(\mathcal{C}))$, which we identify with a diagram

$$(f_0 : X_0 \rightarrow Y_0) \xrightarrow{(u_1, v_1)} (f_1 : X_1 \rightarrow Y_1) \xrightarrow{(u_2, v_2)} \cdots \xrightarrow{(u_n, v_n)} (f_n : X_n \rightarrow Y_n)$$

in the category $\text{Tw}(\mathcal{C})$. Here each $f_i : X_i \rightarrow Y_i$ denotes a morphism in \mathcal{C} , and each (u_i, v_i) is

a pair of morphisms in \mathcal{C} which determine a commutative diagram

$$\begin{array}{ccc} X_{i-1} & \xleftarrow{u_i} & X_i \\ \downarrow f_{i-1} & & \downarrow f_i \\ Y_{i-1} & \xrightarrow{v_i} & Y_i. \end{array}$$

In this case, we can regard the chain of morphisms

$$\begin{array}{ccccccccc} 03JP & X_0 & \xleftarrow{u_1} & X_1 & \xleftarrow{u_2} & X_2 & \xleftarrow{\quad\quad\quad} & \cdots & \xleftarrow{u_n} & X_n \\ & \downarrow f_0 & & & & & & & & \\ & Y_0 & \xrightarrow{v_1} & Y_1 & \xrightarrow{v_2} & Y_2 & \xrightarrow{\quad\quad\quad} & \cdots & \xrightarrow{v_n} & Y_n \end{array} \tag{8.1}$$

as a $(2n+1)$ -simplex of $N_\bullet(\mathcal{C})$, which we identify with an n -simplex $T(\sigma)$ of $\text{Tw}(N_\bullet(\mathcal{C}))$. The construction $\sigma \mapsto T(\sigma)$ then determines a morphism of simplicial sets $T : N_\bullet(\text{Tw}(\mathcal{C})) \rightarrow \text{Tw}(N_\bullet(\mathcal{C}))$, which satisfies conditions (1) and (2) by construction.

We now claim that T is an isomorphism of simplicial sets. Let τ be an n -simplex of $\text{Tw}(N_\bullet(\mathcal{C}))$; we wish to show that there is a unique n -simplex σ of $N_\bullet(\text{Tw}(\mathcal{C}))$ satisfying $T(\sigma) = \tau$. Let us identify τ with a diagram of the form (8.1) in the category \mathcal{C} . We wish to show that there is a unique collection of morphisms $\{f_i : X_i \rightarrow Y_i\}_{1 \leq i \leq n}$ satisfying the identities $f_i = v_i \circ f_{i-1} \circ u_i$, which follows immediately by induction on i .

We now complete the proof by establishing the uniqueness of T . Suppose that $T' : N_\bullet(\text{Tw}(\mathcal{C})) \xrightarrow{\sim} \text{Tw}(N_\bullet(\mathcal{C}))$ is another morphism of simplicial sets satisfying conditions (1) and (2). Then $T^{-1} \circ T'$ determines a functor F from the twisted arrow category $\text{Tw}(\mathcal{C})$ to itself. Because T and T' both satisfy condition (1), the functor F carries each object of $\text{Tw}(\mathcal{C})$ to itself. Since the forgetful functor $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ is faithful, condition (2) guarantees that F also carries each morphism of $\text{Tw}(\mathcal{C})$ to itself. It follows that F is the identity functor, so that $T' = T$. \square

Let \mathcal{C} be a simplicial set. It follows from Proposition 8.1.1.10 that if \mathcal{C} is isomorphic to the nerve of a category, then the simplicial set $\text{Tw}(\mathcal{C})$ is also isomorphic to the nerve of a category. Moreover, the projection maps of Notation 8.1.1.6 determine a left covering map $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ (see Remark 8.1.0.2). This observation has an ∞ -categorical counterpart:

03JQ Proposition 8.1.1.11. *Let \mathcal{C} be an ∞ -category. Then the projection maps of Notation 8.1.1.6 determine a left fibration of simplicial sets*

$$(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}.$$

Corollary 8.1.1.12. *Let \mathcal{C} be an ∞ -category. Then the simplicial set $\text{Tw}(\mathcal{C})$ is also an 03JR ∞ -category.*

Proof. Combine Proposition 8.1.1.11 with Remark 4.1.1.9. \square

Corollary 8.1.1.13. *Let \mathcal{C} be a Kan complex. Then the projection map $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ is a Kan fibration. In particular, $\text{Tw}(\mathcal{C})$ is a Kan complex.*

Proof. Combine Proposition 8.1.1.11 with Corollary 4.4.3.8. \square

In the situation of Corollary 8.1.1.12, we will refer to $\text{Tw}(\mathcal{C})$ as the *twisted arrow ∞ -category of \mathcal{C}* .

Corollary 8.1.1.14. *Let \mathcal{C} be an ∞ -category. Then the projection maps $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ 03JS and $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ are cocartesian fibrations of ∞ -categories. Moreover, a morphism f of $\text{Tw}(\mathcal{C})$ is λ_- -cocartesian if and only if $\lambda_+(f)$ is an isomorphism, and λ_+ -cocartesian if and only if $\lambda_-(f)$ is an isomorphism.*

Proof. Let $\pi_- : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{C}^{\text{op}}$ and $\pi_+ : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{C}$ denote the projection maps. Then π_- and π_+ are cocartesian fibrations of simplicial sets. Moreover, a morphism (e_-, e_+) of $\mathcal{C}^{\text{op}} \times \mathcal{C}$ is π_- -cocartesian if and only if e_+ is an isomorphism in \mathcal{C} , and π_+ -cocartesian if and only if e_- is an isomorphism in \mathcal{C}^{op} (this follows immediately from Remark 5.1.4.6 and Example 5.1.1.4). Corollary 8.1.1.14 now follows by applying Proposition 8.1.1.11 to left and right sides of the diagram

$$\begin{array}{ccccc} & & \text{Tw}(\mathcal{C}) & & \\ & \swarrow \lambda_- & \downarrow (\lambda_-, \lambda_+) & \searrow \lambda_+ & \\ \mathcal{C}^{\text{op}} & \xleftarrow{\pi_-} & \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{\pi_+} & \mathcal{C}, \end{array}$$

since the vertical map in the center is a left fibration (Proposition 8.1.1.11). \square

Proposition 8.1.1.11 is a special case of the following more general assertion:

Proposition 8.1.1.15. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of simplicial sets. Then the 03JT projection maps of Notation 8.1.1.6 determine a left fibration of simplicial sets*

$$\text{Tw}(\mathcal{C}) \rightarrow (\mathcal{C}^{\text{op}} \times \mathcal{C}) \times_{(\mathcal{D}^{\text{op}} \times \mathcal{D})} \text{Tw}(\mathcal{D}).$$

Proof. Fix a pair of integers $0 < i \leq n$; we wish to show that every lifting problem

$$\begin{array}{ccc} 03JU & \Lambda_{n-i}^n & \xrightarrow{\quad} \text{Tw}(\mathcal{C}) \\ & \downarrow & \searrow \dashrightarrow \\ & \Delta^n & \xrightarrow{\quad} (\mathcal{C}^{\text{op}} \times \mathcal{C}) \times_{(\mathcal{D}^{\text{op}} \times \mathcal{D})} \text{Tw}(\mathcal{D}) \end{array} \quad (8.2)$$

admits a solution.

For each nonempty subset $S \subseteq [2n+1] = \{0 < 1 < \dots < 2n+1\}$, let σ_S denote the corresponding nondegenerate simplex of Δ^{2n+1} . Let us say that S is *basic* if it satisfies one of the following conditions:

- (a) The set S is contained in $\{0 < 1 < \dots < n\}$.
- (b) The set S is contained in $\{n+1 < n_2 < \dots < 2n+1\}$.
- (c) There exists an integer $j \neq i$ such that $0 \leq j \leq n$ and $S \cap \{j, 2n+1-j\} = \emptyset$.

Let $K_0 \subseteq \Delta^{2n+1}$ be the simplicial subset whose nondegenerate simplices have the form σ_S , where S is basic. Unwinding the definitions, we can rewrite (8.2) as a lifting problem

$$\begin{array}{ccc} K_0 & \xrightarrow{\quad} & \mathcal{C} \\ \downarrow & \nearrow \dashrightarrow & \downarrow U \\ \Delta^{2n+1} & \xrightarrow{\quad} & \mathcal{D}. \end{array}$$

Since U is an inner fibration, it will suffice to show that the inclusion $K_0 \hookrightarrow \Delta^{2n+1}$ is an inner anodyne map of simplicial sets.

We now introduce two more collections of subsets of $[2n+1]$.

- We say that a subset $S \subseteq [2n+1]$ is *primary* if it is not basic, the intersection $S \cap \{0, 1, \dots, i-1\}$ is empty, and $2n+1-i \in S$.
- We say that a subset $S \subseteq [2n+1]$ is *secondary* if it is not basic, the intersection $S \cap \{0, 1, \dots, i-1\}$ is nonempty, and $i \in S$.

Let $\{S_1, S_2, \dots, S_m\}$ be an ordering of the collection of all subsets of $[2n+1]$ which are either primary or secondary, satisfying the following conditions:

- The sequence of cardinalities $|S_1|, |S_2|, \dots, |S_m|$ is nondecreasing. That is, for $1 \leq p \leq q \leq m$, we have $|S_p| \leq |S_q|$.

- If $|S_p| = |S_q|$ for $p \leq q$ and S_q is primary, then S_p is also primary.

For $1 \leq q \leq m$, let $\sigma_q \subseteq \Delta^{2n+1}$ denote the simplex spanned by the vertices of S_q , and let K_q denote the union of K_0 with the simplices $\{\sigma_1, \sigma_2, \dots, \sigma_q\}$. We have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

Note that we have $\sigma_m = K_m = \Delta^{2n+1}$ (since the set $[2n+1]$ is secondary). It will therefore suffice to show that for $1 \leq q \leq m$, the inclusion map $K_{q-1} \hookrightarrow K_q$ is inner anodyne.

In what follows, we regard q as fixed. Let d be the dimension of the simplex σ_q . Let us abuse notation by identifying σ_q with a morphism of simplicial sets $\Delta^d \rightarrow K_q \subseteq \Delta^{2n+1}$, and set $L = \sigma_q^{-1}K_{q-1} \subseteq \Delta^d$. To complete the proof, it will suffice to show that L is an inner horn of Δ^d , so that the diagram of simplicial sets

$$\begin{array}{ccc} L & \longrightarrow & K_{q-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\sigma_q} & K_q. \end{array}$$

is a pushout square by virtue of Lemma 3.1.2.10.

We first consider the case where the set $S_q = \{j_0 < j_1 < \dots < j_d\}$ is primary, so that we have $j_0 \geq i$ and $j_k = 2n+1-i$ for some $0 \leq k \leq d$. Note that we must have $k > 0$ (otherwise S_q satisfies condition (b)) and $k < d$ (otherwise, S_q satisfies condition (c), since it is disjoint from $\{0, 2n+1\}$). In this case, we will show that L coincides with the inner horn $\Lambda_k^d \subset \Delta^d$. This can be restated as follows:

- (*) Let j be an element of S_q , and set $S' = S_q \setminus \{j\}$. Then $\sigma_{S'}$ is contained in K_{q-1} if and only if $j \neq 2n+1-i$.

Assume first that $j \neq 2n+1-i$. Then the set S' contains $2n+1-i$ and satisfies $S' \cap \{0, 1, \dots, i-1\} = \emptyset$. Consequently, the set S' is either primary (and therefore coincides with $S_{q'}$ for some $q' < q$) or basic. In either case, the simplex $\sigma_{S'}$ belongs to the simplicial subset $K_{q-1} \subseteq \Delta^{2n+1}$.

We now prove (*) in the case $j = 2n+1-i$. Since S_q does not satisfy conditions (b) or (c), the set S' also does not satisfy conditions (b) or (c). It also cannot satisfy condition (a): if S' were contained in the set $\{0, 1, \dots, n\}$, then S_q would be contained in the set $\{i, i+1, \dots, n, 2n+1-i\}$, and would therefore satisfy condition (c). It follows that S' is not basic. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1} . We then have $\sigma_{S'} \subseteq \sigma_{q'}$ for some $q' < q$. Since S' is neither primary nor secondary, this must be a proper inclusion: that is, we must have

$$\dim(\sigma_q) - 1 = \dim(\sigma_{S'}) < \dim(\sigma_{q'}) \leq \dim(\sigma_q).$$

It follows that the second inequality must be an equality: that is, we have $|S_{q'}| = |S_q|$ and therefore $S_{q'}$ is also primary. In particular, the set $S_{q'}$ contains $2n + 1 - i$, and therefore contains the union $S' \cup \{2n + 1 - i\} = S_q$. Since S_q and $S_{q'}$ have the same cardinality, it follows that $S_q = S_{q'}$ and therefore $q = q'$, contradicting our assumption that $q' < q$.

We now consider the case where $S_q = \{j_0 < j_1 < \dots < j_d\}$ is secondary, so that we have $j_0 < i$ and $j_k = i$ for some $0 < k \leq d$. Note that we must have $k < d$ (otherwise, S_q satisfies condition (a)). In this case, we will show that L coincides with the inner horn $\Lambda_k^d \subset \Delta^d$. This can be restated as follows:

($*$) Let $j \in S_q$ and set $S' = S_q \setminus \{j\}$. Then the simplex $\sigma_{S'}$ is contained in K_{q-1} if and only if $j = i$.

We first treat the case where $j \neq i$, so that $i \in S'$. If S' is basic, then $\sigma_{S'} \subseteq K \subseteq K_{q-1}$. We may therefore assume that S' is not basic. If the intersection $S' \cap \{0, 1, \dots, i-1\}$ is nonempty, then S' is secondary and has smaller cardinality than S_q . It follows that $S' = S_{q'}$ for some $q' < q$, so that $\sigma_{S'} \subseteq K_{q'} \subseteq K_{q-1}$. We may therefore assume that the intersection $S' \cap \{0, 1, \dots, i-1\}$ is empty. In this case, the union $S' \cup \{2n + 1 - i\}$ is a primary set of cardinality $\leq |S_q|$, and therefore has the form $S_{q'}$ for some $q' < q$. From this, we again conclude that $\sigma_{S'} \subseteq K_{q'} \subseteq K_{q-1}$.

We now prove ($*$) in the case $j = i$. Since S_q does not satisfy conditions (a) or (c), it follows that S' also does not satisfy conditions (a) or (c). The set S' also does not satisfy condition (b), since the intersection $S' \cap \{0, \dots, i-1\}$ is nonempty. It follows that S' is not basic. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1} . We then have $\sigma_{S'} \subseteq \sigma_{q'}$ for some $q' < q$. Since the intersection $S_{q'} \cap \{1, \dots, i-1\}$ is nonempty, the set $S_{q'}$ cannot be primary and is therefore secondary. In particular, the set $S_{q'}$ contains the element i and therefore contains the union $S' \cup \{i\} = S_q$. Combining this observation with the inequality $|S_{q'}| \leq |S_q|$, we deduce that $S_{q'} = S_q$ and therefore $q' = q$, contradicting our assumption that $q' < q$. \square

8.1.2 Homotopy Transport for Twisted Arrows

03JV Let \mathcal{C} be an ∞ -category and let $\text{Tw}(\mathcal{C})$ denote its twisted arrow ∞ -category. For every pair of objects $X, Y \in \mathcal{C}$, Proposition 8.1.1.11 guarantees that the fiber product

$$\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

is a Kan complex, whose vertices can be identified with morphisms $f : X \rightarrow Y$. Our goal in this section is to show that this identification can be promoted to a homotopy equivalence of Kan complexes

$$\text{Hom}_{\mathcal{C}}^L(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\},$$

where $\text{Hom}_{\mathcal{C}}^L(X, Y) = \mathcal{C}_{X/} \times_{\mathcal{C}} \{Y\}$ denotes the left-pinched morphism space of Construction 4.6.5.1 (see Corollary 8.1.2.10). Our starting point is the following result:

Proposition 8.1.2.1. *Let \mathcal{C} be an ∞ -category and let $f : X \rightarrow Y$ be an isomorphism in \mathcal{C} . Then f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$.*

Remark 8.1.2.2. The converse of Proposition 8.1.2.1 is also true: see Corollary 8.1.2.21. 03JX

We will prove Proposition 8.1.2.1 at the end of this section. First, let us record some consequences.

Corollary 8.1.2.3. *Let \mathcal{C} be a Kan complex. Then the projection maps*

048J

$$\mathcal{C}^{\text{op}} \xleftarrow{\lambda_-} \text{Tw}(\mathcal{C}) \xrightarrow{\lambda_+} \mathcal{C}$$

are trivial Kan fibrations of simplicial sets.

Proof. It follows from Corollary 8.1.1.13 that λ_- and λ_+ are Kan fibrations. It will therefore suffice to show that the fibers of λ_- and λ_+ are contractible Kan complexes (Proposition 3.2.6.15), which is an immediate consequence of Proposition 8.1.2.1 (see Corollary 4.6.6.11). \square

Corollary 8.1.2.4. *Let \mathcal{C} be a simplicial set. Then the projection map $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ is universally localizing (see Definition 6.3.6.1).*

Proof. Writing \mathcal{C} as the filtered colimit of its skeleta $\text{sk}_n(\mathcal{C})$ and using Proposition 6.3.6.11, we can reduce to the case where \mathcal{C} has dimension $\leq n$ for some integer $n \geq 0$. We proceed by induction on n . If $n = 0$, the morphism λ_+ is an isomorphism. Let us therefore assume that n is positive. Let S denote the collection of nondegenerate n -simplices of \mathcal{C} , so that Proposition 1.1.3.13 supplies a pushout square

$$\begin{array}{ccc} S \times \partial\Delta^n & \longrightarrow & S \times \Delta^n \\ \downarrow & & \downarrow \\ \text{sk}_{n-1}(\mathcal{C}) & \longrightarrow & \mathcal{C}, \end{array}$$

where the horizontal maps are monomorphisms. Combining our inductive hypothesis with Proposition 6.3.6.12, we can replace \mathcal{C} by $S \times \Delta^n$ and thereby reduce to the case where \mathcal{C} is an ∞ -category. In this case, λ_+ is a cocartesian fibration (Corollary 8.1.1.14) having weakly contractible fibers (Proposition 8.1.2.1 and Corollary 4.6.6.25), and is therefore universally localizing by virtue of Example 6.3.6.2. \square

048L **Corollary 8.1.2.5.** *Let \mathcal{C} be a simplicial set. Then the projection map $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ is a weak homotopy equivalence.*

Proof. Combine Corollary 8.1.2.4 with Remark 6.3.6.5. \square

048M **Corollary 8.1.2.6.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then F is a weak homotopy equivalence if and only if the induced map $\text{Tw}(F) : \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{D})$ is a weak homotopy equivalence.*

Proof. We have a commutative diagram of simplicial sets

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\text{Tw}(F)} & \text{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \mathcal{D}, \end{array}$$

where the vertical maps are weak homotopy equivalences by virtue of Corollary 8.1.2.4. \square

03JY **Construction 8.1.2.7.** Let \mathcal{C} be a simplicial set and let X be a vertex of \mathcal{C} . Let σ be an n -simplex of the coslice simplicial set $\mathcal{C}_{X/}$, which we identify with a morphism of simplicial sets $\{x\} \star \Delta^n \rightarrow \mathcal{C}$ satisfying $\sigma(x) = X$. Then the composite map

$$(\Delta^n)^{\text{op}} \star \Delta^n \rightarrow \{x\} \star \Delta^n \xrightarrow{\sigma} \mathcal{C}$$

can be identified with an n -simplex of the twisted arrow simplicial set $\text{Tw}(\mathcal{C})$, which we will denote by $\iota_X(\sigma)$. The construction $\sigma \mapsto \iota_X(\sigma)$ is compatible with the formation of face and degeneracy maps, and therefore determines a morphism of simplicial sets $\iota_X : \mathcal{C}_{X/} \rightarrow \text{Tw}(\mathcal{C})$. Moreover, the diagram

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\iota_X} & \text{Tw}(\mathcal{C}) \\ \downarrow & & \downarrow \lambda_- \\ \{X\} & \longrightarrow & \mathcal{C}^{\text{op}} \end{array}$$

commutes, where λ_- is the projection map of Notation 8.1.1.6. It follows that ι_X can be regarded as a morphism of simplicial sets from $\mathcal{C}_{X/}$ to the fiber $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. We will refer to this morphism as the *coslice inclusion*.

03JZ **Remark 8.1.2.8.** Let \mathcal{C} be a simplicial set and let $X \in \mathcal{C}$ be a vertex. Then an n -simplex σ of $\mathcal{C}_{X/}$ can be identified with an $(n + 1)$ -simplex of \mathcal{C} , which we represent informally as a diagram

$$X \xrightarrow{f} Y_0 \xrightarrow{v_1} Y_1 \xrightarrow{v_2} Y_2 \rightarrow \cdots \xrightarrow{v_n} Y_n.$$

The morphism ι_X of Construction 8.1.2.7 carries σ to a $(2n+1)$ -simplex τ of \mathcal{C} , which can be represented informally by the diagram

$$\begin{array}{ccccccccc} X & \xleftarrow{\text{id}} & X & \xleftarrow{\text{id}} & X & \xleftarrow{\text{id}} & \cdots & \xleftarrow{\text{id}} & X \\ \downarrow f & & & & & & & & \\ Y_0 & \xrightarrow{v_1} & Y_1 & \xrightarrow{v_2} & Y_2 & \longrightarrow & \cdots & \xrightarrow{v_n} & Y_n. \end{array}$$

Note that σ can be recovered from τ (by composing with the inclusion map $\Delta^{n+1} \hookrightarrow \Delta^{2n+1}$, given on vertices by $i \mapsto i + n$). It follows that ι_X is a monomorphism of simplicial sets $\mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (as suggested by our terminology).

Proposition 8.1.2.9. *Let \mathcal{C} be an ∞ -category. For every object $X \in \mathcal{C}$, the coslice inclusion 03K0*

$$\iota_X : \mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$$

is an equivalence of ∞ -categories.

Proof. By construction, we have a commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\iota_X} & \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \\ & \searrow & \swarrow \lambda_+ \\ & \mathcal{C}, & \end{array}$$

where the vertical maps are left fibrations of ∞ -categories (Propositions 4.3.6.1 and 8.1.1.11). Moreover, the ∞ -category $\mathcal{C}_{X/}$ has an initial object \tilde{X} , given by the identity morphism $\text{id}_X : X \rightarrow X$ (Proposition 4.6.6.22). Proposition 8.1.2.1 guarantees that $\iota_X(\tilde{X})$ is an initial object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$, so that ι_X is an equivalence of ∞ -categories by virtue of Corollary 5.7.6.20. \square

Corollary 8.1.2.10. *Let \mathcal{C} be an ∞ -category. For every pair of objects $X, Y \in \mathcal{C}$, the coslice inclusion ι_X restricts to a homotopy equivalence of Kan complexes*

$$\text{Hom}_{\mathcal{C}}^L(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}.$$

Proof. Combine Proposition 8.1.2.9 with Corollary 5.1.6.4. \square

Corollary 8.1.2.11. *Let \mathcal{C} be an ∞ -category and let $f, f' : X \rightarrow Y$ be morphisms of \mathcal{C} . 03K2 Then f and f' are homotopic (in the sense of Definition 1.3.3.1) if and only they belong to*

the same connected component of the Kan complex $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$. Consequently, we have a canonical isomorphism of sets

$$\text{Hom}_{\text{h}\mathcal{C}}(X, Y) \simeq \pi_0(\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}).$$

03K3 **Exercise 8.1.2.12.** Prove Corollary 8.1.2.11 directly from the definitions.

03K4 **Exercise 8.1.2.13.** Let \mathcal{C} be an ∞ -category containing morphisms $u : X' \rightarrow X$ and $v : Y \rightarrow Y'$, so that covariant transport for the left fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ determines a morphism of Kan complexes

$$T : \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \{X'\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y'\}.$$

Show that, under the identifications supplied by Corollary 8.1.2.11, the induced map of connected components $\pi_0(T) : \text{Hom}_{\text{h}\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\text{h}\mathcal{C}}(X', Y')$ is given by the construction $[f] \mapsto [v] \circ [f] \circ [u]$.

We now apply Proposition 8.1.2.9 to describe the left fibration $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Proposition 8.1.1.15.

03K5 **Notation 8.1.2.14.** Let \mathcal{C} be an ∞ -category. For every pair of objects $X, Y \in \mathcal{C}$, Proposition 4.6.5.9 and Corollary 8.1.2.10 supply homotopy equivalences of Kan complexes

$$\text{Hom}_{\mathcal{C}}(X, Y) \hookrightarrow \text{Hom}_{\mathcal{C}}^L(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}.$$

Passing to homotopy, we obtain an isomorphism

$$\alpha_{X,Y} : \text{Hom}_{\mathcal{C}}(X, Y) \xrightarrow{\sim} \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

in the homotopy category hKan .

03LX **Corollary 8.1.2.15.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then F is fully faithful if and only if the diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\text{Tw}(F)} & \text{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{F^{\text{op}} \times F} & \mathcal{D}^{\text{op}} \times \mathcal{D} \end{array} \tag{8.3}$$

is a categorical pullback square.

Proof. Since the vertical maps in the diagram (8.3) are left fibrations (Proposition 8.1.1.11), it is a categorical pullback square if and only if, for every pair of objects $X, Y \in \mathcal{C}$, the induced map

$$\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \{F(X)\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{F(Y)\}$$

is a homotopy equivalence of Kan complexes (Corollary 5.1.7.15). Using Notation 8.1.2.14, we see that this is equivalent to the requirement that F induces a homotopy equivalence $\text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{D}}(F(X), F(Y))$. \square

Corollary 8.1.2.16. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be an equivalence of ∞ -categories. Then the induced map $\text{Tw}(F) : \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{D})$ is also an equivalence of ∞ -categories.*

Proof. Combine Corollary 8.1.2.15 with Proposition 4.5.2.20. \square

Corollary 8.1.2.17. *Let \mathcal{C} be an uncountable cardinal and let \mathcal{C} be an ∞ -category. If \mathcal{C} is essentially κ -small, then $\text{Tw}(\mathcal{C})$ is essentially κ -small.*

Proof. Choose an equivalence of ∞ -categories $\mathcal{C}' \rightarrow \mathcal{C}$, where \mathcal{C}' is a κ -small simplicial set. It follows from Corollary 8.1.2.16 that the induced map $\text{Tw}(\mathcal{C}') \rightarrow \text{Tw}(\mathcal{C})$ is also an equivalence of ∞ -categories. We conclude by observing that $\text{Tw}(\mathcal{C}')$ is also a κ -small simplicial set (Remark 8.1.1.5). \square

Corollary 8.1.2.18. *Let \mathcal{C} be an ∞ -category, let $\text{h}\mathcal{C}$ be its homotopy category, and let*

03K6

$$\underline{\text{Hom}}_{\text{h}\mathcal{C}} : \text{h}\mathcal{C}^{\text{op}} \times \text{h}\mathcal{C} \rightarrow \text{hKan} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$$

denote the functor determined by the hKan-enrichment of Construction 4.6.8.13. Then the assignment $(X, Y) \mapsto \alpha_{X, Y}$ of Notation 8.1.2.14 determines an isomorphism from $\underline{\text{Hom}}_{\text{h}\mathcal{C}}$ to the homotopy transport representation of the left fibration $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$.

Proof. Let $H : \text{h}(\mathcal{C}^{\text{op}}) \times \text{h}\mathcal{C} \rightarrow \text{hKan}$ denote the homotopy transport representation for the left fibration (λ_-, λ_+) , given on objects by the formula $H(X, Y) = \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$. For every pair of objects $X, Y \in \mathcal{C}$, Notation 8.1.2.14 determines an isomorphism

$$\alpha_{X, Y} : \underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y) \xrightarrow{\sim} H(X, Y)$$

in the homotopy category hKan . We wish to show that $\alpha_{X, Y}$ depends functorially on X and Y .

We first establish a strong form of functoriality in Y . Fix an object $X \in \mathcal{C}$, and let $h^X : \text{h}\mathcal{C} \rightarrow \text{hKan}$ denote the hKan-enriched functor corepresented by X , given concretely by the formula $h^X(Y) = \underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y) = \text{Hom}_{\mathcal{C}}(X, Y)$. Let $H^X : \text{h}\mathcal{C} \rightarrow \text{hKan}$ denote the restriction $H|_{\{X\} \times \text{h}\mathcal{C}}$, which we also regard as an hKan-enriched functor (using Variant 5.2.8.11). Note

that h^X can be identified with the (enriched) homotopy transport representation of the left fibration $\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{C}$ (see Example 5.2.8.13). Corollary 4.6.4.18 and Proposition 8.1.2.9 supply equivalences

$$\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C} \leftrightarrow \mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$$

of left fibrations over \mathcal{C} , which induce an isomorphism of hKan-enriched functors $\alpha_{X,-} : h^X \xrightarrow{\sim} H^X$. By construction, this isomorphism carries each object $Y \in \text{h}\mathcal{C}$ to the isomorphism $\alpha_{X,Y} : \underline{\text{Hom}}(X, Y) \xrightarrow{\sim} H(X, Y)$ of Notation 8.1.2.14, which proves that $\alpha_{X,Y}$ depends functorially on Y .

We now show that $\alpha_{X,Y}$ depends functorially on X . Fix a morphism $f : W \rightarrow X$ in the ∞ -category \mathcal{C} . We then have a diagram of hKan-enriched functors

$$\begin{array}{ccc} 03K7 & h^X & \xrightarrow{\alpha_{X,-}} H^X \\ & \downarrow & \downarrow \\ & h^W & \xrightarrow{\alpha_{X,-}} H^W, \end{array} \tag{8.4}$$

where the vertical maps are induced by the homotopy class $[f] \in \text{Hom}_{\text{h}\mathcal{C}^{\text{op}}}(X, W)$. To complete the proof, it will suffice to show that this diagram commutes. Using the corepresentability of the hKan-enriched functor h^X , we are reduced to showing that clockwise and counter-clockwise composition around the diagram (8.4) carry $[\text{id}_X] \in \pi_0(h^X(X)) = \text{Hom}_{\text{h}\mathcal{C}}(X, X)$ to the same element of $\pi_0(H^W(X))$. We conclude by observing that under the identification $\pi_0(H^W(X)) \simeq \text{Hom}_{\text{h}\mathcal{C}}(W, X)$ supplied by Corollary 8.1.2.11, both constructions carry $[\text{id}_X]$ to $[f]$ (Exercise 8.1.2.13). \square

03K8 **Warning 8.1.2.19.** Let \mathcal{C} be an ∞ -category. Our proof of Corollary 8.1.2.18 shows that the isomorphism $\alpha_{X,Y} : \underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y) \rightarrow H(X, Y)$ is compatible with the hKan-enrichment in the second variable. Beware that things are a bit more subtle if we wish to view $\underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y)$ and $H(X, Y)$ as hKan-enriched functors of the *first* variable. The functor $\underline{\text{Hom}}_{\text{h}\mathcal{C}}$ is defined using the enrichment of the category $\text{h}\mathcal{C}$, and can therefore be viewed an hKan-enriched functor

$$(\text{h}\mathcal{C})^{\text{op}} \times \text{h}\mathcal{C} \rightarrow \text{hKan}.$$

On the other hand, the functor H is defined as the enriched homotopy transport representation of the left fibration $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$, which is an hKan-enriched functor

$$\text{h}(\mathcal{C}^{\text{op}}) \times \text{h}\mathcal{C} \rightarrow \text{hKan}.$$

The hKan-enriched categories $(\text{h}\mathcal{C})^{\text{op}}$ and $\text{h}(\mathcal{C}^{\text{op}})$ are *a priori* different objects: to a pair of objects $X, Y \in \mathcal{C}$, they assign morphism spaces $\text{Hom}_{\mathcal{C}}(X, Y)$ and $\text{Hom}_{\mathcal{C}}(X, Y)^{\text{op}}$, respectively.

It is possible to address this point (since $\text{Hom}_{\mathcal{C}}(X, Y)$ and $\text{Hom}_{\mathcal{C}}(X, Y)^{\text{op}}$ are canonically isomorphic as objects of the homotopy category hKan), but we will not pursue the matter here.

We can use Proposition 8.1.2.9 to deduce a stronger form of Proposition 8.1.2.1.

Corollary 8.1.2.20. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of ∞ -categories and let $f : X \rightarrow Y$ be a morphism of \mathcal{C} , which we regard as an object of the twisted arrow ∞ -category $\text{Tw}(\mathcal{C})$. Then:*

- *The morphism f is U -cocartesian if and only if it is V -initial, where V denotes the induced map*

$$\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \{U(X)\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D}).$$

- *The morphism f is U -cartesian if and only if it is V' -initial, where V' denotes the induced map*

$$\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{U(Y)\}.$$

Proof. We will prove the first assertion; the proof of the second is similar. Construction 8.1.2.7 supplies a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\iota_X} & \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \\ \downarrow U_{X/} & & \downarrow V \\ \mathcal{D}_{U(X)/} & \xrightarrow{\iota_{U(X)}} & \{U(X)\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories (Proposition 8.1.2.9). By virtue of Remark 7.1.4.9, it will suffice to show that f is U -cocartesian if and only if it is a $U_{X/}$ -initial object of the ∞ -category $\mathcal{C}_{X/}$, which is a special case of Example 7.1.5.9. \square

Corollary 8.1.2.21. *Let \mathcal{C} be an ∞ -category and let $f : X \rightarrow Y$ be a morphism of \mathcal{C} . The following conditions are equivalent:*

- (1) *The morphism f is an isomorphism in the ∞ -category \mathcal{C} .*
- (2) *The morphism f is initial when regarded as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$.*
- (3) *The morphism f is initial when regarded as an object of the ∞ -category $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$.*

Proof. Apply Corollary 8.1.2.20 in the special case $\mathcal{D} = \Delta^0$ (together with Examples 7.1.4.2 and 5.1.1.4). \square

Proof of Proposition 8.1.2.1. Let \mathcal{C} be an ∞ -category and let $f : X \rightarrow Y$ be an isomorphism in \mathcal{C} ; we wish to show that f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. Fix an integer $n > 0$ and a morphism $\rho_0 : \partial\Delta^n \rightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ satisfying $\rho_0(0) = f$; we wish to show that ρ_0 can be extended to an n -simplex of $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$.

We now use a variation on the proof of Proposition 8.1.1.15. For every nonempty subset $S \subseteq [2n+1]$, let σ_S denote the corresponding nondegenerate simplex of Δ^{2n+1} . Let us say that S is *basic* if it satisfies one of the following conditions:

- (a) The set S is contained in $\{0 < 1 < \dots < n\}$.
- (b) There exists an integer $0 \leq i \leq n$ such that $S \cap \{i, 2n+1-i\} = \emptyset$.

Let $K_0 \subseteq \Delta^{2n+1}$ be the simplicial subset whose nondegenerate simplices have the form σ_S , where S is basic. Unwinding the definitions, we can identify ρ_0 with a morphism of simplicial sets $\theta_0 : K \rightarrow \mathcal{C}$, where the composition $\Delta^n \hookrightarrow K \xrightarrow{\theta_0} \mathcal{C}$ is the constant map taking the value X and the composition

$$\Delta^1 \simeq N_{\bullet}(\{n < n+1\}) \hookrightarrow K \xrightarrow{\theta_0} \mathcal{C}$$

is the morphism f . To complete the proof, we must show that θ_0 admits an extension $\theta : \Delta^{2n+1} \rightarrow \mathcal{C}$.

Let S be a nonempty subset of $[2n+1]$ which is not basic. Then there exists an integer $0 \leq i \leq n$ such that $2n+1-i$ belongs to S . We denote the largest such integer by $\text{pr}(S)$ and refer to it as the *priority* of S . We say that S is *prioritized* if it also contained the integer $\text{pr}(S)$. Let $\{S_1, S_2, \dots, S_m\}$ be an ordering of the collection of all prioritized (non-basic) subsets of $[2n+1]$ which satisfies the following conditions:

- The sequence of priorities $\text{pr}(S_1), \text{pr}(S_2), \dots, \text{pr}(S_m)$ is nondecreasing. That is, if $1 \leq p \leq q \leq m$, then we have $\text{pr}(S_p) \leq \text{pr}(S_q)$.
- If $\text{pr}(S_p) = \text{pr}(S_q)$ for $p \leq q$, then $|S_p| \leq |S_q|$.

For $1 \leq q \leq m$, let $\sigma_q \subseteq \Delta^{2n+1}$ denote the simplex spanned by the vertices of S_q , and let $K_q \subseteq \Delta^{2n+1}$ denote the union of K_0 with the simplices $\{\sigma_1, \sigma_2, \dots, \sigma_q\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \dots \hookrightarrow K_m.$$

Note that the set $S = [2n+1]$ is prioritized (with priority n), and is therefore equal to S_m . It follows that $K_m = \Delta^{2n+1}$. We will complete the proof by showing that θ_0 admits a compatible sequence of extensions $\{\theta_q : K_q \rightarrow \mathcal{C}\}_{0 \leq q \leq m}$, so that $\theta = \theta_m$ is an extension of θ_0 to Δ^{2n+1} .

For the remainder of the proof, we fix an integer $1 \leq q \leq m$, and suppose that the morphism $\theta_{q-1} : K_{q-1} \rightarrow \mathcal{C}$ has already been constructed. Let d denote the dimension of

the simplex σ_q , let us abuse notation by identifying σ_q with a morphism of simplicial sets $\Delta^d \rightarrow K_q \subseteq \Delta^{2n+1}$, and set $L = \sigma_q^{-1}K_{q-1} \subseteq \Delta^d$. Let $i = \text{pr}(S_q)$ denote the priority of S_q , so that S_q contains both i and $2n+1-i$. Write $S_q = \{j_0 < j_1 < \dots < j_d\}$, so that $i = j_k$ for some integer $0 \leq k \leq d$. We will prove below that L is equal to the horn $\Lambda_k^d \subseteq \Delta^d$, so that the diagram of simplicial sets

$$\begin{array}{ccc} L & \longrightarrow & K_{q-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\sigma_q} & K_q \end{array}$$

is a pushout square (Lemma 3.1.2.10). Let τ_0 denote the composite map $L \xrightarrow{\sigma_q} K_{q-1} \xrightarrow{\theta_{q-1}} \mathcal{C}$. We will complete the proof by showing that τ_0 admits an extension $\tau : \Delta^d \rightarrow \mathcal{C}$ (which then determines a morphism $\theta_q : K_q \rightarrow \mathcal{C}$ extending θ_{q-1}). The proof splits into four cases:

- Suppose that $0 < k < d$. Then $\Lambda_k^d \subseteq \Delta^d$ is an inner horn, so that τ_0 admits an extension $\tau : \Delta^d \rightarrow \mathcal{C}$ by virtue of our assumption that \mathcal{C} is an ∞ -category.
- Suppose that $k = d$. Then S_q is contained in $\{0, 1, \dots, n\}$, contradicting our assumption that S_q is not basic.
- Suppose $k = 0$ and $i < n$, so that i is the least element of S_q . Our assumption $\text{pr}(S_q) = i$ guarantees that $2n-i \notin S$. Since S_q does not satisfy (b), we must also have $i+1 \in S_q$. It follows that $d \geq 2$ (otherwise, S_q would satisfy (a)), and that $\tau_0 : \Lambda_0^d \rightarrow \mathcal{C}$ carries the initial edge $N_\bullet(\{0 < 1\})$ to the identity morphism id_X . In this case, the existence of the extension τ follows from Theorem 4.4.2.6.
- Suppose $k = 0$ and $i = n$, so that $i = n$ is the least element of S_q . Since S_q has priority n , the element $n+1$ also belongs to S_q . We must then have $d \geq 2$ (otherwise, S_q would satisfy condition (b)). It follows that $\tau_0 : \Lambda_0^d \rightarrow \mathcal{C}$ carries the initial edge $N_\bullet(\{0 < 1\})$ to the morphism f , which is an isomorphism in \mathcal{C} . In this case, the existence of the extension τ again follows from Theorem 4.4.2.6.

It remains to prove that $L = \Lambda_k^d$, which we can formulate more concretely as follows:

- (*) Let j be an element of S_q , and set $S' = S_q \setminus \{j\}$. Then $\sigma_{S'}$ is contained in K_{q-1} if and only if $j \neq i$.

We first treat the case $j = i$; in this case, we wish to show that $\sigma_{S'}$ is not contained in K_{q-1} . Note that S' cannot be basic: it cannot be contained in $\{0, 1, \dots, n\}$ (otherwise

$S_q = S' \cup \{i\}$ would have the same property) and cannot have empty intersection with a set of the form $\{i', 2n + 1 - i'\}$ (otherwise S_q would have the same property; here we use the fact that $2n + 1 - i$ is contained in S_q). Moreover, we have $\text{pr}(S') = i \notin S'$, so that S' is not prioritized. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1} . Then we must have $S' \subseteq S_{q'}$, for some $1 \leq q' < q$. Note that $2n + 1 - i \in S' \subseteq S_{q'}$, so that $S_{q'}$ has priority $\geq i$. Since $q' < q$, it follows that $S_{q'}$ has priority i and that $|S_{q'}| \leq |S_q|$. Since $S_{q'}$ is prioritized, it contains the element i , and therefore contains $S_q = S' \cup \{i\}$. It follows that $S_{q'} = S_q$, contradicting our assumption that $q' < q$.

We now treat the case $j \neq i$; in this case, we wish to show that $\sigma_{S'}$ is contained in K_{q-1} . We may assume without loss of generality that S' is not basic (otherwise, the simplex $\sigma_{S'}$ is already contained in K_0). Let $i' = \text{pr}(S')$ denote the priority of S' ; note that the inclusion $S' \subseteq S_q$ guarantees that $i' \leq i$. If $i' < i$, then $S' \cup \{i'\}$ is a prioritized set of priority $< i$, and therefore of the form $S_{q'}$ for some $q' < q$. If $i' = i$, then S' is a prioritized set of priority i and cardinality $|S_q| - 1$, and therefore of the form $S_{q'}$ for some $q' < q$. In either case, we obtain $\sigma_{S'} \subseteq \sigma_{q'} \subseteq K_{q-1}$. \square

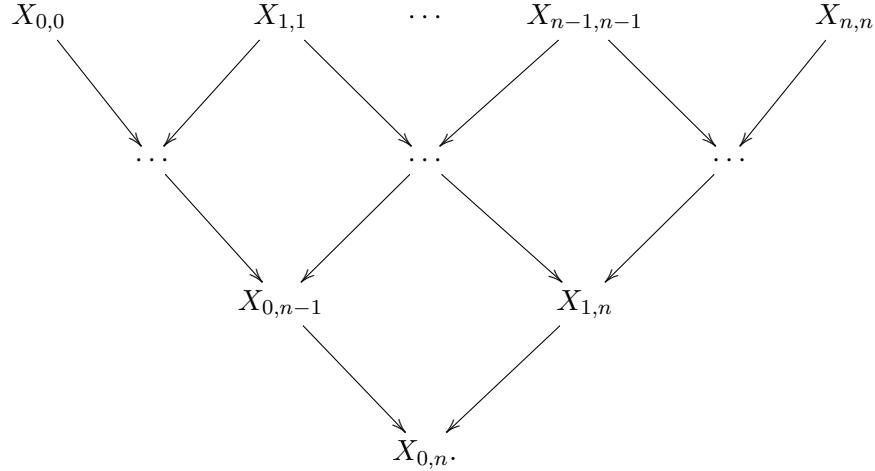

8.1.3 The Cospan Construction

00AY Let \mathcal{C}_0 be a category which admits pushouts. In §2.2.1, we introduced a 2-category $\text{Cospan}(\mathcal{C}_0)$ having the same objects, where 1-morphisms from X to Y in $\text{Cospan}(\mathcal{C}_0)$ are *cospans* from X to Y : that is, diagrams $X \xrightarrow{f} B \xleftarrow{g} Y$ in the category \mathcal{C}_0 (see Example 2.2.2.1). In this section, we introduce a generalization of this construction, which will allow us to replace the ordinary category \mathcal{C}_0 by an ∞ -category. More precisely, we will associate to every simplicial set \mathcal{C} a simplicial set $\text{Cospan}(\mathcal{C})$ of *cospans in \mathcal{C}* (Construction 8.1.3.1). In the special case where $\mathcal{C} = N_\bullet(\mathcal{C}_0)$ is the nerve of a category \mathcal{C}_0 which admits pushouts, we show that $\text{Cospan}(\mathcal{C})$ can be identified with the Duskin nerve of the 2-category $\text{Cospan}(\mathcal{C}_0)$ (Corollary 8.1.3.15).

03KN **Construction 8.1.3.1.** Let \mathcal{C} be a simplicial set. For every integer $n \geq 0$, we let $\text{Cospan}_n(\mathcal{C})$ denote the collection of morphisms $\text{Tw}(\Delta^n) \rightarrow \mathcal{C}$ in the category of simplicial sets. The construction $[n] \mapsto \text{Cospan}_n(\mathcal{C})$ depends functorially on the set $[n] = \{0 < 1 < \dots < n\}$ as an object of the category Δ^{op} , and can therefore be viewed as a simplicial set. We will denote this simplicial set by $\text{Cospan}(\mathcal{C})$ and refer to it as the *simplicial set of cospans in \mathcal{C}* .

03KP **Remark 8.1.3.2.** Let $n \geq 0$ be an integer. Then the simplicial set $\text{Tw}(\Delta^n)$ can be identified with the nerve of the partially ordered set $Q = \{(i, j) \in [n]^{\text{op}} \times [n] : i \leq j\}$ (see Example 8.1.0.5). Consequently, if \mathcal{C} is an arbitrary simplicial set, then n -simplices of $\text{Cospan}(\mathcal{C})$ can

be identified with morphisms $N_\bullet(Q) \rightarrow \mathcal{C}$, which we depict informally as diagrams

Example 8.1.3.3. Let \mathcal{C} be a simplicial set. Then:

03KQ

- Vertices of the simplicial set $\text{Cospan}(\mathcal{C})$ can be identified with vertices of \mathcal{C} .
- Let X and Y be vertices of \mathcal{C} . Then edges of $\text{Cospan}(\mathcal{C})$ joining X to Y can be identified with pairs (f, g) , where $f : X \rightarrow B$ and $g : Y \rightarrow B$ are edges of \mathcal{C} having the same target.

Remark 8.1.3.4 (Symmetry). Let \mathcal{C} be a simplicial set and let σ be an n -simplex of $\text{Cospan}(\mathcal{C})$, which we identify with a morphism of simplicial sets $\text{Tw}(\Delta^n) \rightarrow \mathcal{C}$. Composing with the automorphism

$$\text{Tw}(\Delta^n) \xrightarrow{\sim} \text{Tw}(\Delta^n) \quad (i, j) \mapsto (n - j, n - i),$$

we obtain a new n -simplex $\bar{\sigma}$ of $\text{Cospan}(\mathcal{C})$. The construction $\sigma \mapsto \bar{\sigma}$ determines an isomorphism of simplicial sets $\tau : \text{Cospan}(\mathcal{C}) \simeq \text{Cospan}(\mathcal{C})^{\text{op}}$, which can be described concretely as follows:

- For every vertex $X \in \mathcal{C}$, the morphism τ carries X (regarded as a vertex of $\text{Cospan}(\mathcal{C})$) to itself.
- Let X and Y be vertices of \mathcal{C} , and let $e : X \rightarrow Y$ be an edge of $\text{Cospan}(\mathcal{C})$, given by a pair of edges $(f : X \rightarrow B, g : Y \rightarrow B)$ of \mathcal{C} . Then $\tau(e) : Y \rightarrow X$ is the edge of $\text{Cospan}(\mathcal{C})$ given by the pair (g, f) .

Note that τ is involutive: that is, the composition

$$\text{Cospan}(\mathcal{C}) \xrightarrow{\tau} \text{Cospan}(\mathcal{C})^{\text{op}} \xrightarrow{\tau^{\text{op}}} \text{Cospan}(\mathcal{C})$$

is the identity automorphism of $\text{Cospan}(\mathcal{C})$.

03KT **Construction 8.1.3.5.** Let \mathcal{D} be a simplicial set and let $\sigma : \Delta^n \rightarrow \mathcal{D}$ be an n -simplex of \mathcal{D} . Invoking the functoriality of the twisted arrow construction, we obtain a map $\text{Tw}(\Delta^n) \xrightarrow{\text{Tw}(\sigma)} \text{Tw}(\mathcal{D})$, which we can identify with an n -simplex $u(\sigma)$ of the simplicial set $\text{Cospan}(\text{Tw}(\mathcal{D}))$. The construction $\sigma \mapsto u(\sigma)$ is compatible with face and degeneracy maps, and therefore determines a morphism of simplicial sets $u : \mathcal{D} \rightarrow \text{Cospan}(\text{Tw}(\mathcal{D}))$ which we will refer to as the *unit map*.

048N **Example 8.1.3.6** (Tautological Cospans). Let \mathcal{D} be a simplicial set and let $e : X \rightarrow Y$ be an edge of \mathcal{D} , which we also view as a vertex of the simplicial set $\text{Tw}(\mathcal{D})$. Then the morphism $\mathcal{D} \rightarrow \text{Cospan}(\text{Tw}(\mathcal{D}))$ carries e to an edge of the simplicial set $\text{Cospan}(\text{Tw}(\mathcal{D}))$, which we can identify with a pair of edges

$$\text{id}_X \xrightarrow{e_L} e \xleftarrow{e_R} \text{id}_Y$$

in the simplicial set $\text{Tw}(\mathcal{D})$. Here e_L and e_R can be identified with degenerate 3-simplices of \mathcal{D} , which we depict informally in the diagrams

$$\begin{array}{ccc} X & \xleftarrow{\text{id}_X} & X \\ \downarrow \text{id}_X & & \downarrow \text{id}_Y \\ X & \xrightarrow{f} & Y & \quad & Y & \xleftarrow{f} & X \\ & & \downarrow \text{id}_Y & & & & \downarrow \text{id}_X & \\ & & Y & \xrightarrow{\text{id}_Y} & Y & & & \end{array}$$

03KU **Proposition 8.1.3.7.** Let \mathcal{D} be a simplicial set and let $u : \mathcal{D} \rightarrow \text{Cospan}(\text{Tw}(\mathcal{D}))$ be the unit map of Construction 8.1.3.5. For every simplicial set \mathcal{C} , the composite map

$$\begin{aligned} \text{Hom}_{\text{Set}_\Delta}(\text{Tw}(\mathcal{D}), \mathcal{C}) &\rightarrow \text{Hom}_{\text{Set}_\Delta}(\text{Cospan}(\text{Tw}(\mathcal{D})), \text{Cospan}(\mathcal{C})) \\ &\xrightarrow{\circ u} \text{Hom}_{\text{Set}_\Delta}(\mathcal{D}, \text{Cospan}(\mathcal{C})) \end{aligned}$$

is a bijection.

Proof. Let us regard the simplicial set \mathcal{C} as fixed. For every simplicial set \mathcal{D} , the unit map u of Construction 8.1.3.5 determines a function

$$\theta_{\mathcal{D}} : \text{Hom}_{\text{Set}_\Delta}(\text{Tw}(\mathcal{D}), \mathcal{C}) \rightarrow \text{Hom}_{\text{Set}_\Delta}(\mathcal{D}, \text{Cospan}(\mathcal{C})).$$

Using Remark 8.1.1.4, we see that the construction $\mathcal{D} \mapsto \theta_{\mathcal{D}}$ carries colimits (in the category of simplicial sets) to limits (in the arrow category $\text{Fun}([1], \text{Set})$). Consequently, to show that $\theta_{\mathcal{D}}$ is a bijection, we may assume without loss of generality that $\mathcal{D} = \Delta^n$ is a standard simplex (see Corollary 1.1.8.17). In this case, the desired result follows immediately from the definition of the simplicial set $\text{Cospan}(\mathcal{C})$. \square

Corollary 8.1.3.8. *The twisted arrow functor*

03KV

$$\text{Tw} : \text{Set}_\Delta \rightarrow \text{Set}_\Delta \quad \mathcal{D} \mapsto \text{Tw}(\mathcal{D})$$

has a right adjoint, given on objects by the construction $\mathcal{C} \mapsto \text{Cospan}(\mathcal{C})$.

Remark 8.1.3.9. Let \mathcal{C} and \mathcal{D} be simplicial sets. Using Proposition 8.1.3.7, we obtain 048P bijections

$$\begin{aligned} \text{Hom}_{\text{Set}_\Delta}(\Delta^n, \text{Fun}(\mathcal{C}, \text{Cospan}(\mathcal{D}))) &\simeq \text{Hom}_{\text{Set}_\Delta}(\Delta^n \times \mathcal{C}, \text{Cospan}(\mathcal{D})) \\ &\simeq \text{Hom}_{\text{Set}_\Delta}(\text{Tw}(\Delta^n \times \mathcal{C}), \mathcal{D}) \\ &\simeq \text{Hom}_{\text{Set}_\Delta}(\text{Tw}(\Delta^n) \times \text{Tw}(\mathcal{C}), \mathcal{D}) \\ &\simeq \text{Hom}_{\text{Set}_\Delta}(\text{Tw}(\Delta^n), \text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D})) \\ &\simeq \text{Hom}_{\text{Set}_\Delta}(\Delta^n, \text{Cospan}(\text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D}))). \end{aligned}$$

These bijections depend functorially on $[n] \in \Delta$, and therefore determine an isomorphism of simplicial sets $\text{Fun}(\mathcal{C}, \text{Cospan}(\mathcal{D})) \simeq \text{Cospan}(\text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D}))$.

Corollary 8.1.3.10. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a Kan fibration of simplicial sets. Then the induced 048Q map $\text{Cospan}(U) : \text{Cospan}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$ is also a Kan fibration.*

Proof. Let $i : A \hookrightarrow B$ be a monomorphism of simplicial sets which is a weak homotopy equivalence. We wish to show that every lifting problem

$$\begin{array}{ccc} A & \xrightarrow{\quad} & \text{Cospan}(\mathcal{C}) \\ \downarrow i & \nearrow \text{dashed} & \downarrow \text{Cospan}(U) \\ B & \xrightarrow{\quad} & \text{Cospan}(\mathcal{D}) \end{array} \tag{8.5}$$

048R

admits a solution. Using Proposition 8.1.3.7, we can rewrite (8.5) as a lifting problem of the form

$$\begin{array}{ccc} \text{Tw}(A) & \xrightarrow{\quad} & \mathcal{C} \\ \downarrow \text{Tw}(i) & \nearrow \text{dashed} & \downarrow U \\ \text{Tw}(B) & \xrightarrow{\quad} & \mathcal{D}. \end{array}$$

Our assumption that U is a Kan fibration guarantees that this lifting problem has a solution, since the monomorphism $\text{Tw}(i) : \text{Tw}(A) \hookrightarrow \text{Tw}(B)$ is also a weak homotopy equivalence (Corollary 8.1.2.6). \square

048S **Corollary 8.1.3.11.** *Let \mathcal{C} be a Kan complex. Then the simplicial set $\text{Cospan}(\mathcal{C})$ is also a Kan complex.*

Proof. Apply Corollary 8.1.3.10 in the special case $\mathcal{D} = \Delta^0$. \square

We now study the relationship between Construction 8.1.3.1 with the classical cospan construction (Example 2.2.2.1).

00B4 **Construction 8.1.3.12.** Let \mathcal{C} be a category which admits pushouts, and let $\text{Cospan}(\mathcal{C})$ denote the 2-category of Example 2.2.2.1. Suppose we are given another category \mathcal{D} and a functor $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$. We define a strictly unitary lax functor $F^+ : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$ as follows:

- For each $X \in \mathcal{D}$, we define $F^+(X) = F(\text{id}_X)$; here we regard the identity morphism $\text{id}_X : X \rightarrow X$ as an object of the twisted arrow category $\text{Tw}(\mathcal{C})$.
- For each morphism $f : X \rightarrow Y$ in \mathcal{D} , we define $F^+(f)$ to be the 1-morphism of $\text{Cospan}(\mathcal{C})$ given by the cospan

$$F(\text{id}_X) \xrightarrow{F(\text{id}_X, f)} F(f) \xleftarrow{F(f, \text{id}_Y)} F(\text{id}_Y).$$

Note that this determines the values of F^+ on 2-morphisms, since every 2-morphism in \mathcal{D} is an identity 2-morphism.

- For every pair of composable morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$ in \mathcal{D} , the composition constraint $\mu_{g,f} : F^+(g) \circ F^+(f) \Rightarrow F^+(g \circ f)$ is the 2-morphism of $\text{Cospan}(\mathcal{C})$ corresponding to the map $F(f) \amalg_{F(\text{id}_Y)} F(g) \rightarrow F(g \circ f)$ classifying the commutative diagram

$$\begin{array}{ccc} F(\text{id}_Y) & \xrightarrow{F(f, \text{id}_Y)} & F(f) \\ \downarrow F(\text{id}_Y, g) & & \downarrow F(\text{id}_X, g) \\ F(g) & \xrightarrow{F(f, \text{id}_Z)} & F(g \circ f) \end{array}$$

in the category \mathcal{C} .

03KW **Example 8.1.3.13.** Let \mathcal{C} be a category which admits pushouts and let n be a nonnegative integer. Applying Construction 8.1.3.12 in the special case where $\mathcal{D} = [n]$, we obtain a function

$$\{\text{Functors } \text{Tw}([n]) \rightarrow \mathcal{C}\} \xrightarrow{\sim} \{\text{Strictly unitary lax functors } [n] \rightarrow \text{Cospan}(\mathcal{C})\}.$$

Using Propositions 1.2.2.1 and 8.1.1.10, we can identify the left hand side with the collection of n -simplices of the simplicial set $\text{Cospan}(N_\bullet(\mathcal{C}))$. This construction depends functorially on n , and therefore determines a morphism of simplicial sets from $\text{Cospan}(N_\bullet(\mathcal{C}))$ to the Duskin nerve $N_\bullet^D(\text{Cospan}(\mathcal{C}))$.

We can now formulate our main result.

Theorem 8.1.3.14. *Let \mathcal{C} and \mathcal{D} be categories, where \mathcal{C} admits pushouts. Then Construction 00B5 8.1.3.12 induces a bijection of sets*

$$\{\text{Functors } F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}\} \xrightarrow{\sim} \{\text{Strictly unitary lax functors } F^+ : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})\}.$$

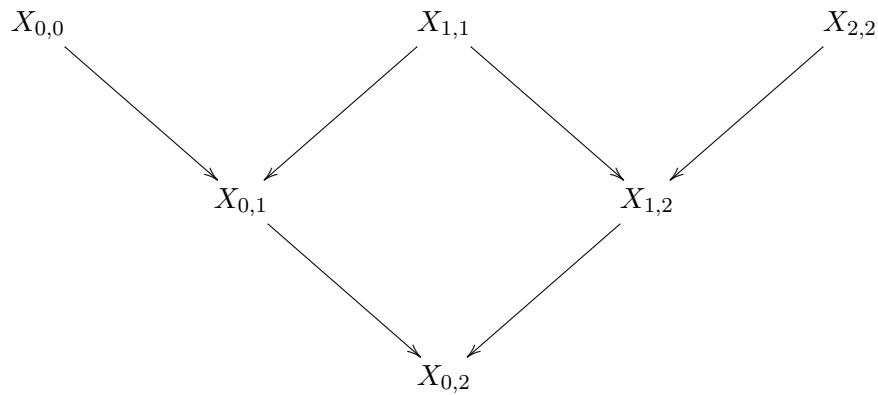

Corollary 8.1.3.15. *Let \mathcal{C} be a category which admits pushouts. Then the comparison map 00B6 of Example 8.1.3.13 determines an isomorphism of simplicial sets*

$$\text{Cospan}(N_\bullet(\mathcal{C})) \rightarrow N_\bullet^D(\text{Cospan}(\mathcal{C})).$$

Exercise 8.1.3.16. Show that Corollary 8.1.3.15 implies Theorem 8.1.3.14. That is, to 03KX prove Theorem 8.1.3.14 in general, it suffices to treat the special case where \mathcal{D} is a category of the form $[n] = \{0 < 1 < \dots < n\}$ for $n \geq 0$.

Remark 8.1.3.17. Let \mathcal{C} be a category which admits pushouts. The construction of the 03KY 2-category $\text{Cospan}(\mathcal{C})$ of Example 2.2.2.1 involves some auxiliary choices: if $X \rightarrow B \leftarrow Y$ and $Y \rightarrow C \leftarrow Z$ are cospans in \mathcal{C} , then their composition (as 1-morphisms of $\text{Cospan}(\mathcal{C})$) is given by $X \rightarrow (B \amalg_Y C) \leftarrow Z$, where the pushout $B \amalg_Y C$ is only well-defined up to (canonical) isomorphism. Corollary 8.1.3.15 supplies a description of the Duskin nerve $N_\bullet^D(\text{Cospan}(\mathcal{C}))$ which does not depend on these choices. This shows, in particular, that the 2-category $\text{Cospan}(\mathcal{C})$ is well-defined up to (non-strict) isomorphism; see Example 2.2.6.13.

Example 8.1.3.18. Let \mathcal{C} be a category which admits pushouts. Then 2-simplices σ of the 00B8 Duskin nerve $N_\bullet^D(\text{Cospan}(\mathcal{C}))$ can be identified with commutative diagrams

in the category \mathcal{C} . It follows from Theorem 2.3.2.5 that the 2-simplex σ is thin (in the sense of Definition 2.3.2.3) if and only if the square appearing in the diagram is a pushout: that is, it induces an isomorphism $X_{0,1} \amalg_{X_{1,1}} X_{1,2} \rightarrow X_{0,2}$ in the category \mathcal{C} .

Proof of Theorem 8.1.3.14. Let \mathcal{C} and \mathcal{D} be categories, where \mathcal{C} admits pushouts, and let $G : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$ be a strictly unitary lax functor of 2-categories. For every morphism $f : X \rightarrow Y$ in the category \mathcal{D} , we can identify $G(f)$ with a cospan from $G(X)$ to $G(Y)$ in the category \mathcal{C} , given by a diagram we will denote by $G(X) \xrightarrow{b_-(f)} B(f) \leftarrow b_+(f)G(Y)$. Our assumption that G is strictly unitary guarantees the following:

- (*) For each object $X \in \mathcal{D}$, the object $B(\text{id}_X)$ is equal to $G(X)$, and the maps $b_-(\text{id}_X) : G(X) \rightarrow B(\text{id}_X)$ and $b_+(\text{id}_X) : G(X) \rightarrow B(\text{id}_X)$ are the identity morphisms from $G(X)$ to itself in the category \mathcal{C} .

For every pair of composable 1-morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$, the composition constraint $\mu_{g,f}$ for the lax functor G can be identified with a morphism from the pushout $B(f) \amalg_{G(Y)} B(g)$ to $B(g \circ f)$, or equivalently with a pair of morphisms

$$p(g, f) : B(f) \rightarrow B(g \circ f) \quad q(g, f) : B(g) \rightarrow B(g \circ f)$$

satisfying $p(g, f) \circ b_+(f) = q(g, f) \circ b_-(g)$. The axioms for a lax functor (Definition 2.2.4.5) then translate to the following additional conditions:

- (a) For every morphism $f : X \rightarrow Y$ in the category \mathcal{D} , $p(\text{id}_Y, f)$ is the identity morphism from $B(f)$ to itself.
- (b) For every morphism $f : X \rightarrow Y$ in the category \mathcal{D} , $q(f, \text{id}_X)$ is the identity morphism from $B(f)$ to itself.
- (c) For every composable triple of 1-morphisms $W \xrightarrow{f} X \xrightarrow{g} Y \xrightarrow{h} Z$ in the category \mathcal{D} , we have

$$p(h \circ g, f) = p(h, g \circ f) \circ p(g, f) \quad q(h, g \circ f) = q(h \circ g, f) \circ q(h, g)$$

$$p(h, g \circ f) \circ q(g, f) = q(h \circ g, f) \circ p(h, g).$$

We wish to show that there exists a unique functor of ordinary categories $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ such that $G = F^+$, where F^+ is the lax functor associated to F by Construction 8.1.3.12. For this condition to be satisfied, the functor F must satisfy the following conditions:

- (0) For each object $X \in \mathcal{D}$, we have $F(\text{id}_X) = G(X)$ (this guarantees that G and F^+ coincide on objects).

- (1) For each morphism $f : X \rightarrow Y$ in \mathcal{D} (regarded as an object of $\text{Tw}(\mathcal{D})$), we have $F(f) = B(f)$, and the morphisms $b_-(f)$ and $b_+(f)$ are given by $F(\text{id}_X, f)$ and $F(f, \text{id}_Y)$, respectively (this guarantees that G and F^+ coincide on 1-morphisms, and therefore also on 2-morphisms).
- (2) For every pair of composable 1-morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$, the morphisms $p(g, f) : B(f) \rightarrow B(g \circ f)$ and $q(g, f) : B(g) \rightarrow B(g \circ f)$ are given by $F(\text{id}_X, g) : F(f) \rightarrow F(g \circ f)$ and $F(f, \text{id}_Z) : F(g) \rightarrow F(g \circ f)$, respectively (this guarantees that the composition constraints on G and F^+ coincide).

Note that the value of F on each object of $\text{Tw}(\mathcal{D})$ is determined by condition (1). Moreover, if (u, v) is a morphism from $f : X \rightarrow Y$ to $f' : X' \rightarrow Y'$ in the category $\text{Tw}(\mathcal{D})$, then condition (2) guarantees that $F(u, v)$ must be equal to the composition

$$F(f) = B(f) \xrightarrow{q(f, u)} B(f \circ u) \xrightarrow{p(v, f \circ u)} B(v \circ f \circ u) = B(f') = F(f').$$

This proves the uniqueness of the functor F .

To prove existence, we define F on objects f of $\text{Tw}(\mathcal{D})^{\text{op}}$ by the formula $F(f) = B(f)$, and on morphisms $(u, v) : f \rightarrow f'$ by the formula $F(u, v) = p(v, f \circ u) \circ q(f, u)$. For any morphism $f : X \rightarrow Y$ in \mathcal{C} , we can use (a) and (b) to compute

$$F(\text{id}_X, \text{id}_Y) = p(\text{id}_X, f) \circ q(f, \text{id}_Y) = \text{id}_{B(f)} \circ \text{id}_{B(f)} = \text{id}_{B(f)},$$

so that F carries identity morphisms in $\text{Tw}(\mathcal{D})$ to identity morphisms in \mathcal{C} . To complete the proof that F is a functor, we note that for every pair of composable morphisms

$$(f : X \rightarrow Y) \xrightarrow{(u, v)} (f' : X' \rightarrow Y') \xrightarrow{(u', v')} (f'' : X'' \rightarrow Y'')$$

in the twisted arrow category $\text{Tw}(\mathcal{D})$, the identities given in (c) allow us to compute

$$\begin{aligned} F(u', v') \circ F(u, v) &= p(v', f' \circ u') \circ q(f', u') \circ p(v, f \circ u) \circ q(f, u) \\ &= p(v', v \circ f \circ u \circ u') \circ q(v \circ f \circ u, u') \circ p(v, f \circ u) \circ q(f, u) \\ &= p(v', v \circ f \circ u \circ u') \circ p(v, f \circ u \circ u') \circ q(f \circ u, u') \circ q(f, u) \\ &= p(v' \circ v, f \circ u \circ u') \circ q(f, u \circ u') \\ &= F(u \circ u', v' \circ v). \end{aligned}$$

We now complete the proof by showing that the functor F satisfies conditions (0), (1), and (2). Condition (0) is an immediate consequence of (*). To prove (2), we note that for any pair of composable morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$ in \mathcal{D} , identities (a) and (b) yield equalities

$$F(\text{id}_X, g) = p(g, f) \circ q(f, \text{id}_X) = p(g, f) \quad F(f, \text{id}_Z) = p(\text{id}_Z, g \circ f) \circ q(g, f) = q(g, f).$$

To prove (1), we note that if $f : X \rightarrow Y$ is a morphism in \mathcal{D} , then we have

$$\begin{aligned} F(\text{id}_X, f) &= p(f, \text{id}_X \circ \text{id}_X) \circ q(\text{id}_X, \text{id}_X) \\ &= p(f, \text{id}_X) \circ \text{id}_{G(X)} \\ &= p(f, \text{id}_X) \circ b_+(\text{id}_X) \\ &= q(f, \text{id}_X) \circ b_-(f) \\ &= \text{id}_{B(f)} \circ b_-(f) \\ &= b_-(f), \end{aligned}$$

and a similar calculation yields $F(f, \text{id}_Y) = b_+(f)$. \square

8.1.4 Cospans in ∞ -Categories

03L4 Let \mathcal{C} be an ∞ -category, and let $\text{Cospan}(\mathcal{C})$ denote the simplicial set of cospans in \mathcal{C} (Construction 8.1.3.1). In the special case where $\mathcal{C} = N_\bullet(\mathcal{C}_0)$ is the nerve of an ordinary category \mathcal{C}_0 which admits pushouts, Corollary 8.1.3.15 supplies an isomorphism of $\text{Cospan}(\mathcal{C})$ with the Duskin nerve of the 2-category $\text{Cospan}(\mathcal{C}_0)$ of Example 2.2.2.1. In particular, $\text{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category (see Proposition 5.5.1.7). Our goal in this section is to prove an ∞ -categorical generalization of this result.

03L5 **Proposition 8.1.4.1.** *Let \mathcal{C} be an ∞ -category. Then the simplicial set $\text{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category if and only if \mathcal{C} admits pushouts.*

Our proof of Proposition 8.1.4.1 will require several steps. The main ingredient is the following characterization of thin 2-simplices of $\text{Cospan}(\mathcal{C})$, which we will establish in §8.1.5:

03L6 **Proposition 8.1.4.2.** *Let \mathcal{C} be an ∞ -category and let σ be a 2-simplex of $\text{Cospan}(\mathcal{C})$, which we identify with a diagram*

03L7

$$(8.6)$$

in the ∞ -category \mathcal{C} . Then σ is thin (in the sense of Definition 2.3.2.3) if and only if the inner region is a pushout square in the ∞ -category \mathcal{C} .

Corollary 8.1.4.3. *Let \mathcal{C} be an ∞ -category. Then every degenerate 2-simplex of $\text{Cospan}(\mathcal{C})$ 03L8 is thin.*

Proof. Let σ be a 1-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$, corresponding to a diagram $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category \mathcal{C} where f belongs to L and g belongs to R . We will show that the left-degenerate 2-simplex $s_0(\sigma)$ is thin; a similar argument will show that the right-degenerate 2-simplex $s_1(\sigma)$ is thin (see Remark 8.1.3.4). Unwinding the definitions, we see that $s_0(\sigma)$ corresponds to a diagram in \mathcal{C} of the form

$$\begin{array}{ccccc}
X & & X & & Y \\
& \searrow \text{id}_X & \swarrow \text{id}_X & \searrow f & \swarrow g \\
& X & & B & \\
& \searrow f & \swarrow \text{id}_B & & \\
& & B. & &
\end{array}$$

By virtue of Proposition 8.1.4.2, it will suffice to show that the inner region of the diagram is a pushout square in \mathcal{C} . This follows from Corollary 7.6.3.18, since id_B and id_X are isomorphisms in \mathcal{C} . \square

Lemma 8.1.4.4. *Let \mathcal{C} be an ∞ -category and let $\sigma_0 : \Lambda_1^2 \rightarrow \text{Cospan}(\mathcal{C})$ be a morphism of 048T simplicial sets, corresponding to a diagram*

$$\begin{array}{ccccc}
X_{0,0} & & X_{1,1} & & X_{2,2} \\
& \searrow & \swarrow u & \searrow v & \swarrow \\
& & X_{0,1} & & X_{1,2} \\
& \swarrow & & \searrow & \\
& & X_{1,1} & &
\end{array} \tag{8.7}$$

03LA

in the ∞ -category \mathcal{C} . Then any commutative diagram

$$\begin{array}{ccc}
X_{1,1} & \xrightarrow{u} & X_{1,2} \\
\downarrow v & & \downarrow \\
X_{0,1} & \longrightarrow & X_{0,2}
\end{array} \tag{8.8}$$

048U

can be obtained from an extension of σ_0 to a 2-simplex of $\text{Cospan}(\mathcal{C})$. In particular, if $X_{1,2}$ and $X_{0,1}$ admit a pushout along $X_{1,1}$, then σ_0 can be extended to a thin 2-simplex of \mathcal{C} .

Proof. Let us identify $\text{Tw}(\Delta^2)$ with the simplicial set $N_\bullet(\overline{Q})$, where \overline{Q} denotes the partially ordered set $\{(i, j) \in [2]^{\text{op}} \times [2] : i \leq j\}$. Under this identification, $\text{Tw}(\Lambda_1^2)$ corresponds to the simplicial subset $N_\bullet(Q) \subseteq N_\bullet(\overline{Q})$, where $Q = \overline{Q} \setminus \{(0, 2)\}$, so σ_0 determines a diagram $\tau : N_\bullet(Q) \rightarrow \mathcal{C}$.

Set $Q_0 = Q \setminus \{(0, 0), (2, 2)\}$ and $\tau_0 = \tau|_{N_\bullet(Q_0)}$. Lemma 8.1.4.4 is equivalent to the assertion that the restriction map $\mathcal{C}_{\tau/} \rightarrow \mathcal{C}_{\tau_0/}$ is surjective on vertices. To prove this, it will suffice to show that the inclusion map $N_\bullet(Q_0) \hookrightarrow N_\bullet(Q)$ is right anodyne (Corollary 4.3.6.13), or equivalently that it is right cofinal (Proposition 7.2.1.3). This is a special case of Corollary 7.2.3.7, since the inclusion map $Q_0 \hookrightarrow Q$ has a left adjoint (given by $(0, 0) \mapsto (0, 1)$ and $(2, 2) \mapsto (1, 2)$). \square

03LB **Remark 8.1.4.5.** Let \mathcal{C} be an ∞ -category and suppose we are given a morphism of simplicial sets $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$, which we display as a diagram

$$\begin{array}{ccccc}
 X_{0,0} & & X_{1,1} & & X_{2,2} \\
 \searrow & & \swarrow & & \swarrow \\
 & X_{0,1} & & X_{1,2} & \\
 & \searrow & & \swarrow & \\
 & & X_{0,2} & &
 \end{array}$$

The proof of Lemma 8.1.4.4 shows that φ is a colimit diagram if and only if the inner region is a pushout square.

We now study the problem of filling outer horns in simplicial sets of the form $\text{Cospan}(\mathcal{C})$.

048V **Lemma 8.1.4.6.** *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of simplicial sets. Suppose we are given an integer $n \geq 3$ and a lifting problem*

048W

$$\begin{array}{ccc}
 \Lambda_0^n & \xrightarrow{\sigma_0} & \text{Cospan}(\mathcal{C}) \\
 \downarrow & \nearrow \text{dashed} & \downarrow \text{Cospan}(U) \\
 \Delta^n & \xrightarrow{\bar{\sigma}} & \text{Cospan}(\mathcal{D}),
 \end{array} \tag{8.9}$$

where σ_0 corresponds to a morphism of simplicial sets $F_0 : \text{Tw}(\Lambda_0^n) \rightarrow \mathcal{C}$ with the following properties:

- (a) The morphism F_0 carries the edge $(0, 0) \rightarrow (0, 1)$ of $\text{Tw}(\Lambda_0^n)$ to a U -cocartesian edge of \mathcal{C} .
- (b) The morphism F_0 carries the edge $(1, n) \rightarrow (0, n)$ to a U -cartesian edge of \mathcal{C} .

Then the lifting problem (8.9) admits a solution.

Proof. Using Proposition 8.1.3.7, we can rewrite (8.9) as a lifting problem

$$\begin{array}{ccc} \text{Tw}(\Lambda_0^n) & \xrightarrow{F_0} & \mathcal{C} \\ \downarrow & \nearrow & \downarrow U \\ \text{Tw}(\Delta^n) & \xrightarrow{\bar{F}} & \mathcal{D}. \end{array} \quad \begin{matrix} 048X \\ (8.10) \end{matrix}$$

Let P denote the set of all ordered pairs (i, j) , where i and j are integers satisfying $0 \leq i \leq j \leq n$. We regard P as a partially ordered set by identifying it with its image in the product $[n]^{\text{op}} \times [n]$ (so that $(i, j) \leq (i', j')$ if and only if $i' \leq i$ and $j \leq j'$). In what follows, we will identify $\text{Tw}(\Delta^n)$ with the nerve $N_{\bullet}(P)$; under this identification, $\text{Tw}(\Lambda_0^n)$ corresponds to a simplicial subset $K_0 \subseteq N_{\bullet}(P)$.

Let $S = \{(i_0, j_0) < (i_1, j_1) < \dots < (i_d, j_d)\}$ be a nonempty linearly ordered subset of P , so that we have inequalities $0 \leq i_d \leq i_{d-1} \leq \dots \leq i_0 \leq j_0 \leq j_1 \leq \dots \leq j_d \leq n$. In this case, we write τ_S for the corresponding nondegenerate d -simplex of $N_{\bullet}(P)$. We will say that S is *basic* if τ_S is contained in K_0 . Equivalently, S is basic if the set $\{i_0, i_1, \dots, i_d, j_0, j_1, \dots, j_d\}$ does not contain $\{1 < 2 < \dots < n\}$. If S is not basic, we let $\text{pr}(S)$ denote the largest integer j such that S contains the pair (i, j) for some $i \neq 0$. If no such integer exists, we define $\text{pr}(S) = 0$. We will refer to $\text{pr}(S)$ as the *priority* of S . We say that S is *prioritized* if it is not basic and contains the pair $(0, \text{pr}(S))$.

Let $\{S_1, S_2, \dots, S_m\}$ be an enumeration of the collection of all prioritized linearly ordered subsets of P which satisfies the following conditions:

- The sequence of priorities $\text{pr}(S_1), \text{pr}(S_2), \dots, \text{pr}(S_m)$ is nondecreasing. That is, if $1 \leq k \leq \ell \leq m$, then we have $\text{pr}(S_k) \leq \text{pr}(S_\ell)$.
- If $\text{pr}(S_k) = \text{pr}(S_\ell)$ for $k \leq \ell$, then $|S_k| \leq |S_\ell|$.

For $1 \leq \ell \leq m$, let $\tau_\ell \subseteq N_{\bullet}(P)$ denote the simplex τ_{S_ℓ} and let $K_\ell \subseteq N_{\bullet}(P)$ denote the union of K_0 with the simplices $\{\tau_1, \tau_2, \dots, \tau_\ell\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \dots \hookrightarrow K_m.$$

We claim that $K_m = N_{\bullet}(P)$: that is, K_m contains τ_S for every nonempty linearly ordered subset $S \subseteq P$. If S is basic, there is nothing to prove. We may therefore assume that S

has priority p for some integer $p \geq 0$. The union $S \cup \{(0, p)\}$ is then a prioritized linearly ordered subset of P , and therefore coincides with S_ℓ for some $1 \leq \ell \leq m$. In this case, we have $\tau_S \subseteq \tau_\ell \subseteq K_\ell \subseteq K_m$.

We will complete the proof by constructing a compatible sequence of maps $F_\ell : K_\ell \rightarrow \mathcal{C}$ extending F_0 and satisfying $U \circ F_\ell = \bar{F}|_{K_\ell}$. Fix an integer $1 \leq \ell \leq m$, and suppose that $F_{\ell-1}$ has already been constructed. Write $S_\ell = \{(i_0, j_0) < (i_1, j_1) < \dots < (i_d, j_d)\}$, so that the simplex τ_ℓ has dimension d . Let p be the priority of S_ℓ . Since S_ℓ is prioritized, it contains $(0, p)$; we can therefore write $(0, p) = (i_{d'}, j_{d'})$ for some integer $0 \leq d' \leq d$. Let $L \subseteq \Delta^d$ denote the inverse image of $K_{\ell-1}$ under the map $\tau_\ell : \Delta^d \rightarrow N_\bullet(P)$. We will show that L coincides with the horn $\Lambda_{d'}^d$, so that the pullback diagram of simplicial sets

$$\begin{array}{ccc} L & \longrightarrow & K_{\ell-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\tau_\ell} & K_\ell. \end{array}$$

is also a pushout square (Lemma 3.1.2.10). This can be stated more concretely as follows:

- (*) Let (i, j) be an element of S_ℓ , and set $S' = S_\ell \setminus \{(i, j)\}$. Then the simplex $\tau_{S'}$ is contained in $K_{\ell-1}$ if and only if $(i, j) \neq (0, p)$.

We first prove (*) in the case where $(i, j) \neq (0, p)$; in this case, we wish to show that $\tau_{S'}$ is contained in $K_{\ell-1}$. If S' is basic, then $\tau_{S'}$ is contained in K_0 and there is nothing to prove. Let us therefore assume that S' is not basic. Let $p' = \text{pr}(S')$ denote the priority of S' . Then the union $S' \cup \{(0, p')\}$ is a prioritized subset of P , and therefore has the form S_k for some $1 \leq k \leq m$. By construction, we have $\text{pr}(S_k) = p' \leq p = \text{pr}(S_\ell)$. Moreover, if $p' = p$, then our assumption $(i, j) \neq (0, p)$ guarantees that $S_k = S'$, so that $|S_k| < |S_\ell|$. It follows that $k < \ell$, so that we have $\tau_{S'} \subseteq \tau_k \subseteq K_k \subseteq K_{\ell-1}$.

We now prove (*) in the case $(i, j) = (0, p)$; in this case, we wish to show that $\tau_{S'}$ is not contained in $K_{\ell-1}$. Assume otherwise. Then, since S' is not basic, it is contained in S_k for some $k < \ell$. The inequalities

$$p = \text{pr}(S') \leq \text{pr}(S_k) \leq \text{pr}(S_\ell) = p.$$

ensure that S_k has priority p . Since S_k is prioritized, it contains $(0, p)$, and therefore contains the union $S_\ell = S' \cup \{(0, p)\}$. The inequality $|S_k| \leq |S_\ell|$ then forces $k = \ell$, contradicting our assumption that $k < \ell$. This completes the proof of (*).

Let ρ_0 denote the composite map $\Lambda_{d'}^d = L \xrightarrow{\tau_\ell} K_{\ell-1} \xrightarrow{F_{\ell-1}} \mathcal{C}$. To complete the proof, it

will suffice to show that the lifting problem

$$\begin{array}{ccc}
 \Lambda_{d'}^d & \xrightarrow{\rho_0} & \mathcal{C} \\
 & \nearrow & \downarrow U \\
 \Delta^d & \xrightarrow{\overline{F} \circ \tau_\ell} & \mathcal{D}
 \end{array} \tag{8.11}$$
048Y

admits a solution. We consider three cases:

- If $0 < d' < d$, then the lifting problem (8.11) admits a solution by virtue of our assumption that U is an inner fibration of simplicial sets.
- Suppose that $d' = 0$: that is, the pair $(0, p)$ is the smallest element of S_ℓ . Then S_ℓ does not contain any pairs (i, j) with $i \neq 0$, so we have $p = 0$. Since the set S_ℓ is not basic, we must have $S_\ell = \{(0, 0) < (0, 1) < \dots < (0, n-1) < (0, n)\}$. In this case, the lifting problem (8.11) admits a solution by virtue of assumption (a).
- Suppose that $d' = d$: that is, the pair $(0, p)$ is the largest element of S_ℓ . Our assumption that S_ℓ is not basic then guarantees that $p = n$ and $(1, n) = S_\ell$: that is, we have $S_\ell = \{(i_0, j_0) < (i_1, j_1) < \dots < (1, n) < (0, n)\}$. In this case, the lifting problem (8.11) admits a solution by virtue of assumption (b).

□

Specializing Lemma 8.1.4.6 to the case $\mathcal{D} = \Delta^0$, we obtain the following:

Lemma 8.1.4.7. *Let \mathcal{C} be an ∞ -category and let $\sigma_0 : \Lambda_0^n \rightarrow \text{Cospan}(\mathcal{C})$ be a morphism of 03LC simplicial sets, which we identify with a diagram $X : \text{Tw}(\Lambda_0^n) \rightarrow \text{Cospan}(\mathcal{C})$. Assume that $n \geq 3$ and that the morphisms $X(0, 0) \rightarrow X(0, 1)$ and $X(1, n) \rightarrow X(0, n)$ are isomorphisms in \mathcal{C} . Then σ_0 can be extended to an n -simplex of $\text{Cospan}(\mathcal{C})$.*

Proof of Proposition 8.1.4.1. Let \mathcal{C} be an ∞ -category. By virtue of Lemma 8.1.4.7 and Corollary 8.1.4.3, the simplicial set $\text{Cospan}(\mathcal{C})$ satisfies conditions (2) and (3) of Definition 5.5.1.3. Since $\text{Cospan}(\mathcal{C})$ is isomorphic to $\text{Cospan}(\mathcal{C})^{\text{op}}$ (Remark 8.1.3.4), it also satisfies condition (4) of Definition 5.5.1.3. It follows that $\text{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category if and only if it satisfies the following condition:

- (*) Every morphism of simplicial sets $\Lambda_1^2 \rightarrow \text{Cospan}(\mathcal{C})$ can be extended to a thin 2-simplex of $\text{Cospan}(\mathcal{C})$.

Using Lemma 8.1.4.4, we can rewrite condition (*) as follows:

($*$) For every diagram

$$\begin{array}{ccccc} X & \searrow & Y & \searrow & Z \\ & & B & & C \\ & & \downarrow & & \downarrow \\ & & & & \end{array}$$

in the ∞ -category \mathcal{C} , there exists a pushout of B and C along Y .

It is clear that if the ∞ -category \mathcal{C} admits pushouts, then it satisfies condition ($*$). The converse follows by applying condition ($*$) to diagrams of the form

$$\begin{array}{ccccc} X & \searrow^{\text{id}_X} & Y & \searrow^{\text{id}_Z} & Z \\ & & X & & Z \\ & & \downarrow & & \downarrow \\ & & & & \end{array}$$

□

03LD Corollary 8.1.4.8. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{C} and \mathcal{D} admit pushouts. The following conditions are equivalent:*

- (1) *The functor F carries pushout squares in \mathcal{C} to pushout squares in \mathcal{D} .*
- (2) *The induced map $\text{Cospan}(F) : \text{Cospan}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$ is a functor of $(\infty, 2)$ -categories, in the sense of Definition 5.5.7.1.*

Proof. The implication (1) \Rightarrow (2) follows immediately from the criterion of Proposition 8.1.4.2. For the converse implication, suppose that $\text{Cospan}(F) : \text{Cospan}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$ is a functor of 2-categories, and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a pushout square, which we display as a diagram

$$\begin{array}{ccc} X & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X_{01}. \end{array}$$

Let $\rho : \text{Tw}(\Delta^2) \rightarrow \Delta^1 \times \Delta^1$ denote the morphism of simplicial sets given on vertices by the formula $\rho(i, j) = (\max(0, 1 - i), \max(0, j - 1))$. Then $\sigma \circ \rho$ can be identified with a 2-simplex

τ of $\text{Cospan}(\mathcal{C})$, corresponding to a diagram

$$\begin{array}{ccccc}
 & X_0 & & X & X_1 \\
 & \searrow \text{id} & & \swarrow & \downarrow \text{id} \\
 X_0 & & X_0 & & X_1 \\
 & \swarrow & & \searrow & \\
 & & & & X_{01}
 \end{array}$$

in the ∞ -category \mathcal{C} . It follows from the criterion of Proposition 8.1.4.2 that τ is a thin 2-simplex of $\text{Cospan}(\mathcal{C})$. If $\text{Cospan}(F)$ is a functor of $(\infty, 2)$ -categories, then it carries τ to a thin 2-simplex of $\text{Cospan}(\mathcal{D})$. Applying the criterion of Proposition 8.1.4.2 again, we conclude that $F(\sigma)$ is a pushout square in \mathcal{D} . \square

8.1.5 Thin 2-Simplices of $\text{Cospan}(\mathcal{C})$

Let \mathcal{C} be an ∞ -category. Our goal in this section is to prove Proposition 8.1.4.2, which provides necessary and sufficient conditions for a 2-simplex of the simplicial set $\text{Cospan}(\mathcal{C})$ to be thin. By virtue of Remark 8.1.4.5, it will suffice to prove the following pair of assertions:

Lemma 8.1.5.1. *Let \mathcal{C} be an ∞ -category and let σ be a 2-simplex of $\text{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. If σ is thin, then φ is a colimit diagram.*

Lemma 8.1.5.2. *Let \mathcal{C} be an ∞ -category and let σ be a 2-simplex of $\text{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. If φ is a colimit diagram, then σ is thin.*

Proof of Lemma 8.1.5.1. Let Q denote the partially ordered set appearing in the proof of Lemma 8.1.4.4, so that we can identify $\text{Tw}(\Lambda_1^2)$ with the nerve of Q . Set $\varphi_0 = \varphi|_{N_\bullet(Q)}$. Assume that σ is thin. We wish to show that the restriction map $\mathcal{C}_{\varphi/} \rightarrow \mathcal{C}_{\varphi_0/}$ is a trivial Kan fibration: that is, every lifting problem

$$\begin{array}{ccc}
 \partial\Delta^n & \longrightarrow & \mathcal{C}_{\varphi/} \\
 \downarrow & \nearrow & \downarrow \\
 \Delta^n & \longrightarrow & \mathcal{C}_{\varphi_0/}
 \end{array}
 \tag{8.12}$$

03LH

admits a solution.

Let K denote the coproduct $(\text{Tw}(\Delta^2) \star \partial\Delta^n) \coprod_{(N_\bullet(Q) \star \partial\Delta^n)} (N_\bullet(Q) \star \Delta^n)$, which we regard as a simplicial subset of $\text{Tw}(\Delta^2) \star \Delta^n$. Unwinding the definitions, we can identify the lifting problem (8.12) with a morphism of simplicial sets $\tau_0 : K \rightarrow \mathcal{C}$ satisfying $\tau_0|_{\text{Tw}(\Delta^2)} = \varphi$. We wish to show that τ_0 can be extended to a morphism $\tau : \text{Tw}(\Delta^2) \star \Delta^n \rightarrow \mathcal{C}$.

Let $\iota : \text{Tw}(\Delta^2) \star \Delta^n \rightarrow \text{Tw}(\Delta^{n+3})$ be the morphism of simplicial sets given on vertices by the formula

$$\iota(x) = \begin{cases} (i, j) & \text{if } x = (i, j) \in \text{Tw}(\Delta^2) \\ (0, x + 3) & \text{if } x \in \Delta^n. \end{cases}$$

The morphism ι has a left inverse $\rho : \text{Tw}(\Delta^{n+3}) \rightarrow \text{Tw}(\Delta^2) \star \Delta^n$, given on vertices by the formula

$$\rho(i, j) = \begin{cases} (i, j) \in \text{Tw}(\Delta^2) & \text{if } j \leq 2 \\ j - 3 \in \Delta^n & \text{otherwise.} \end{cases}$$

We observe that ι and ρ restrict to morphisms of simplicial subsets

$$\iota_0 : K \rightarrow \text{Tw}(\Lambda_1^{n+3}) \quad \rho_0 : \text{Tw}(\Lambda_1^{n+3}) \rightarrow K,$$

so that we have a commutative diagram of simplicial sets

$$\begin{array}{ccccc} K & \xrightarrow{\iota_0} & \Lambda_1^{n+3} & \xrightarrow{\rho_0} & K \\ \downarrow & & \downarrow & & \downarrow \\ \text{Tw}(\Delta^2) \star \Delta^n & \xrightarrow{\iota} & \Delta^{n+3} & \xrightarrow{\rho} & \text{Tw}(\Delta^2) \star \Delta^n \end{array}$$

where the horizontal compositions are equal to the identity.

The composition $\tau_0 \circ \rho_0$ can be identified with a morphism of simplicial sets $\psi_0 : \Lambda_1^{m+3} \rightarrow \text{Cospan}(\mathcal{C})$ having the property that the composition

$$\Delta^2 \simeq N_\bullet(\{0 < 1 < 2\}) \xrightarrow{\psi_0} \text{Cospan}(\mathcal{C})$$

coincides with σ . Since σ is thin, we can extend ψ_0 to an $(n+3)$ -simplex ψ of $\text{Cospan}(\mathcal{C})$, which we identify with a map $\tau' : \text{Tw}(\Delta^{n+3}) \rightarrow \mathcal{C}$. It follows that the composition $\tau = \tau' \circ \iota$ is a morphism $\text{Tw}(\Delta^2) \star \Delta^n \rightarrow \mathcal{C}$ satisfying $\tau|_K = \tau_0$. \square

Proof of Lemma 8.1.5.2. Let \mathcal{C} be an ∞ -category and let σ be a 2-simplex of $\text{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. Assume that φ is a colimit diagram. We wish to show that σ is thin. We proceed by a (somewhat more complicated) variation on the proof of Lemma 8.1.4.7.

Fix integers $0 < q < n$ with $n \geq 3$, and suppose that we are given a morphism $f_0 : \Lambda_q^n \rightarrow \text{Cospan}(\mathcal{C})$ for which the composition

$$\Delta^2 \simeq N_\bullet(\{q-1 < q < q+1\}) \hookrightarrow \Lambda_q^n \xrightarrow{f_0} \text{Cospan}(\mathcal{C})$$

is equal to σ ; we wish to show that f_0 can be extended to an n -simplex of $\text{Cospan}(\mathcal{C})$. Using Proposition 8.1.3.7, we can identify f_0 with a morphism of simplicial sets $F_0 : \text{Tw}(\Lambda_q^n) \rightarrow \mathcal{C}$; we wish to show that F_0 admits an extension $\text{Tw}(\Delta^n) \rightarrow \mathcal{C}$.

Let P denote the set of all ordered pairs (i, j) , where i and j are integers satisfying $0 \leq i \leq j \leq n$. We regard P as a partially ordered set by identifying it with its image in the product $[n]^{\text{op}} \times [n]$ (so that $(i, j) \leq (i', j')$ if and only if $i' \leq i$ and $j \leq j'$). In what follows, we will identify $\text{Tw}(\Delta^n)$ with the nerve $N_\bullet(P)$; under this identification, $\text{Tw}(\Lambda_q^n)$ corresponds to a simplicial subset $K_0 \subseteq N_\bullet(P)$.

Let $S = \{(i_0, j_0) < (i_1, j_1) < \dots < (i_d, j_d)\}$ be a nonempty linearly ordered subset of P , so that we have inequalities $0 \leq i_d \leq i_{d-1} \leq \dots \leq i_0 \leq j_0 \leq j_1 \leq \dots \leq j_d \leq n$. In this case, we write τ_S for the corresponding nondegenerate d -simplex of $N_\bullet(P)$. Let $C(S)$ denote the set of integers $\{i_0, i_1, \dots, i_d, j_0, j_1, \dots, j_d\}$, which we regard as a subset of $[n] = \{0 < 1 < \dots < n\}$; we will refer to $C(S)$ as the *content* of S . We will say that:

- The set S is *basic* if $C(S) \cup \{q\} \neq [n]$. Equivalently, S is basic if the simplex τ_S is contained in K_0 .
- The set S is *low* if it is not basic and it contains an ordered pair $(p, q+1)$ for some $p \leq q-2$. In this case, we denote the largest such integer p by $\text{pr}(S)$ and refer to it as the *priority* of S .
- The set S is *high* if it is not basic and it contains an ordered pair $(q-1, r)$ for some $r \geq q+2$.

Note that the set S cannot be both low and high, since the elements $(p, q+1)$ and $(q-1, r)$ are incomparable in P when $p < q < r$. Moreover, if S is low, then any nonempty subset $S' \subseteq S$ is either low (and satisfies $\text{pr}(S') \leq \text{pr}(S)$) or satisfies $q+1 \notin C(S')$, so that S' is basic (the set S' cannot contain any elements of the form $(q+1, r)$, since these are incomparable with $(p, q+1)$). Consequently, the collection of simplices of the form τ_S where S is either basic or low determine a simplicial subset $K_{\text{low}} \subseteq N_\bullet(P)$. Similarly, the collection of simplices of the form τ_S where S is either basic or high determine a simplicial subset $K_{\text{high}} \subseteq N_\bullet(P)$, and the intersection $K_{\text{low}} \cap K_{\text{high}}$ is equal to K_0 .

We will prove the following:

- (*) The inclusion maps $K_0 \hookrightarrow K_{\text{low}}$ and $K_0 \hookrightarrow K_{\text{high}}$ are inner anodyne.

We will prove that the inclusion map $K_0 \hookrightarrow K_{\text{low}}$ is inner anodyne; the analogous assertion for the inclusion $K_0 \hookrightarrow K_{\text{high}}$ follows by a similar argument. Let us say that a linearly ordered subset $S \subseteq Q$ is *prioritized* if it low and contains the ordered pair (p, q) , where $p = \text{pr}(S)$ denotes the priority of S .

Let $\{S_1, S_2, \dots, S_m\}$ be an enumeration of the collection of all prioritized low subsets of P which satisfies the following conditions:

- The sequence of priorities $\text{pr}(S_1), \text{pr}(S_2), \dots, \text{pr}(S_m)$ is nondecreasing. That is, if $1 \leq k \leq \ell \leq m$, then we have $\text{pr}(S_k) \leq \text{pr}(S_\ell)$.
- If $\text{pr}(S_k) = \text{pr}(S_\ell)$ for $k \leq \ell$, then $|S_k| \leq |S_\ell|$.

For $1 \leq \ell \leq m$, let $\tau_\ell \subseteq N_\bullet(P)$ denote the simplex τ_{S_ℓ} and let K_ℓ denote the union of K_0 with the simplices $\{\tau_1, \tau_2, \dots, \tau_\ell\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \dots \hookrightarrow K_m.$$

We claim that $K_m = K_{\text{low}}$: that is, every low subset $S \subseteq P$ is contained in S_ℓ for some $1 \leq \ell \leq m$. This is clear: if $p = \text{pr}(S)$ is the priority of S , then the union $S \cup \{(p, q)\}$ is a prioritized low subset of Q (having the same priority p).

We will prove $(*)$ by showing that, for $1 \leq \ell \leq m$, the inclusion map $K_{\ell-1} \hookrightarrow K_\ell$ is inner anodyne. Set $S_q = \{(i_0, j_0) < (i_1, j_1) < \dots < (i_d, j_d)\}$. Let p denote the priority of S_ℓ . Since S_ℓ is prioritized, it contains the ordered pair (p, q) . We therefore have $(p, q) = (i_c, j_c)$ for some $0 \leq c \leq d$. Note that since $p \leq r - 2$, we must have $c > 0$: otherwise, we have $q - 1 \notin C(S_\ell)$, contradicting our assumption that S_ℓ is not basic. Since S_ℓ also contains $(p, q + 1)$, we must also have $c < d$. Let $L \subseteq \Delta^d$ denote the inverse image of $K_{\ell-1}$ under the map $\tau_\ell : \Delta^d \rightarrow N_\bullet(P)$. We will complete the proof of $(*)$ by showing that L coincides with the inner horn Λ_c^d , so that the pullback diagram of simplicial sets

$$\begin{array}{ccc} L & \longrightarrow & K_{\ell-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\tau_\ell} & K_\ell \end{array}$$

is also a pushout square (Lemma 3.1.2.10). This can be stated more concretely as follows:

- $(*)'$ Let (i, j) be an element of S_ℓ , and set $S' = S_\ell \setminus \{(i, j)\}$. Then the simplex $\tau_{S'}$ is contained in $K_{\ell-1}$ if and only if $(i, j) \neq (p, q)$.

We first prove $(*)'$ in the case where $(i, j) \neq (p, q)$; in this case, we wish to show that $\tau_{S'}$ is contained in $K_{\ell-1}$. If S' is basic, then $\tau_{S'}$ is contained in K_0 and there is nothing to prove.

We may therefore assume that S' is not basic, and is therefore low. If $(i, j) \neq (p, q + 1)$, then S' is a prioritized low subset of Q satisfying $\text{pr}(S') = p = \text{pr}(S_\ell)$ and $|S'| < |S_\ell|$. It follows that $S' = S_k$ for some $k < \ell$, so that $\tau_{S'}$ is contained in $K_k \subseteq K_{\ell-1}$. In the case $(i, j) = (p, q + 1)$, the set S' has priority $p' = \text{pr}(S') < p$. It follows that $S' \cup \{(p', q)\}$ is a prioritized low subset of Q having priority $p' < \text{pr}(S_q)$, and is therefore of the form S_k for some $k < \ell$. In this case, we again conclude that $\tau_{S'}$ is contained in $K_k \subseteq K_{\ell-1}$.

We now prove $(*)'$ in the case where $(i, j) = (p, q)$; in this case, we wish to show that $\tau_{S'}$ is not contained in $K_{\ell-1}$. Note that, since S' contains $(p, q + 1)$, we have $C(S') \cup \{q\} = C(S_\ell) \cup \{q\}$. Since S_ℓ is not basic, it follows that S' is not basic. Assume, for a contradiction, that $\tau_{S'}$ is contained in $K_{\ell-1}$; it follows that we have $S' \subseteq S_k$ for some $1 \leq k \leq \ell$. We then have $\text{pr}(S_k) \leq \text{pr}(S_\ell) = p$. Since S_k contains $(p, q + 1)$, we must have $\text{pr}(S_k) = p$. Since S_k is prioritized, it contains (p, q) , and therefore contains $S' \cup \{(p, q)\} = S_\ell$. The inequality $k < \ell$ guarantees that $|S_k| \leq |S_\ell|$. It follows that $S_k = S_\ell$, contradicting our assumption that $k < \ell$. This completes the proof of $(*)$.

Since \mathcal{C} is an ∞ -category, assertion $(*)$ guarantees that the morphism $F_0 : K_0 \rightarrow \mathcal{C}$ admits an extension $F_{\text{low}} : K_{\text{low}} \rightarrow \mathcal{C}$ (Proposition 1.4.6.7). Similarly, the morphism F_0 admits an extension $F_{\text{high}} : K_{\text{high}} \rightarrow \mathcal{C}$. Let K denote the union of K_{low} with K_{high} (as simplicial subsets of $N_\bullet(P)$). Since the intersection $K_{\text{low}} \cap K_{\text{high}}$ coincides with K_0 , we can amalgamate F_{low} with F_{high} to obtain a morphism of simplicial sets $F : K \rightarrow \mathcal{C}$. We will complete the proof of Proposition 8.1.4.2 by showing that F can be extended to a morphism $N_\bullet(P) \rightarrow \mathcal{C}$.

Set $P_- = \{(i, j) \in P : (i, j) < (q - 1, q + 1)\}$ and $P_+ = \{(i, j) \in P : (i, j) > (q - 1, q + 1)\}$. Let us say that a nonempty linearly ordered subset $S \subseteq P$ is *decomposable* if the union $S \cup \{(q - 1, q + 1)\}$ is also linearly ordered. In this case, we can write S (uniquely) as a union $S_- \cup S_0 \cup S_+$, where $S_- \subseteq P_-$, $S_0 \subseteq \{(q - 1, q + 1)\}$, and $S_+ \subseteq P_+$. The collection of simplices τ_S , where S is decomposable, span a simplicial subset of $N_\bullet(P)$ which will identify with the join $N_\bullet(P_-) \star \{(q - 1, q + 1)\} \star N_\bullet(P_+)$.

We next claim that $N_\bullet(P)$ is the union of K with the join $N_\bullet(P_-) \star \{(q - 1, q + 1)\} \star N_\bullet(P_+)$. In other words, if a nonempty linearly ordered subset $S \subseteq P$ is not decomposable, then τ_S is contained in K . Choose an element $(i, j) \in S$ which is incomparable with $(q - 1, q + 1)$ in the partially ordered set P . Without loss of generality, we may assume that $i < q - 1$ and $j < q + 1$. If S is basic, there is nothing to prove. We may therefore assume that $q + 1$ belongs to the content $C(S)$. Note that ordered pairs of the form $(q + 1, r)$ are incomparable with (i, j) , and therefore cannot be contained in S . It follows that S contains an element of the form $(p, q + 1)$. Since $(p, q + 1)$ is comparable with (i, j) in P , we must have $p \leq i \leq q - 2$. It follows that S is low, so that τ_S is contained in $K_{\text{low}} \subseteq K$.

Let $K' \subseteq K$ denote the intersection of K with the join $N_\bullet(P_-) \star \{(q - 1, q + 1)\} \star N_\bullet(P_+)$,

so that we have a pushout diagram of simplicial sets

$$\begin{array}{ccc} K' & \longrightarrow & K \\ \downarrow & & \downarrow \\ N_{\bullet}(P_-) \star \{(q-1, q+1)\} \star N_{\bullet}(P_+) & \longrightarrow & N_{\bullet}(P). \end{array}$$

Set $F' = F|_{K'}$. To complete the proof, it will suffice to show that F' can be extended to a morphism of simplicial sets $N_{\bullet}(P_-) \star \{(q-1, q+1)\} \star N_{\bullet}(P_+) \rightarrow \mathcal{C}$.

We now give a more explicit description of K' . Let us say that a linearly ordered subset $S_+ \subseteq P_+$ is *old* if the simplex $\tau_{S_+ \cup \{(q-1, q+1)\}}$ is contained in K . Let $S \subseteq P$ be an arbitrary decomposable subset, and write $S = S_- \cup S_0 \cup S_+$ as above. We then make the following observations:

- (a) Suppose that $S_0 = \{(q-1, q+1)\}$. Then replacing S by the subset $S_0 \cup S_+$ does not change the set $C(S) \cup \{q\}$. In particular, S is basic if and only if $S_0 \cup S_+$ is basic. Moreover, since S_- does not contain any pairs of the form $(p, q+1)$ for $p \leq q-1$, it follows that S is low if and only if $S_0 \cup S_+$ is low. Similarly, S is high if and only if $S_0 \cup S_+$ is high. It follows that τ_S is contained in K if and only if $\tau_{S_0 \cup S_+}$ is contained in K : that is, if and only if S_+ is old.
- (b) Suppose that $S_0 = \emptyset$. In this case, we claim that τ_S is automatically contained in K . Assume otherwise. Then S is not basic, so the set $C(S)$ contains the element $q+1$. Since ordered pairs of the form $(q+1, q')$ are incomparable with $(q-1, q+1)$ for $q' > q+1$, it follows that S contains an ordered pair of the form $(p, q+1)$ for some $p \leq q+1$. Since S is not low, we must have $p \geq q-1$. By assumption, S does not contain $(q-1, q+1)$, so we must have $p \in \{q, q+1\}$. By the same reasoning (using the fact that $C(S)$ contains $q-1$ and S is not high), we conclude that S contains an element of the form $(q-1, r)$ for $r \in \{q-1, q\}$. This is a contradiction, since S is linearly ordered and the ordered pairs $(p, q+1)$ and $(q-1, r)$ are incomparable in P .

Let $A \subseteq N_{\bullet}(P_+)$ denote the simplicial subset spanned by the simplices τ_{S_+} , where S_+ is old. Combining (a) and (b), we deduce that K' can be identified with the pushout

$$(N_{\bullet}(P_-) \star \{(q-1, q+1)\} \star A) \coprod_{N_{\bullet}(P_-) \star A} (N_{\bullet}(P_-) \star N_{\bullet}(P_+)).$$

Note that, since the restriction of f_0 to the simplex $N_{\bullet}(\{q-1 < q < q+1\})$ coincides with σ , the restriction of F' to the simplicial subset $N_{\bullet}(P_-) \star \{(q-1, q+1)\} \subseteq K$ can be identified with the diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. Let φ_0 denote the restriction of φ to

$N_\bullet(P_-)$. Unwinding the definitions, we see that the problem of extension of F' to a morphism $N_\bullet(P_-) \star \{(q-1, q+1)\} \star N_\bullet(P_+) \rightarrow \mathcal{C}$ can be rewritten as a lifting problem

$$\begin{array}{ccc} A & \xrightarrow{\quad} & \mathcal{C}_{\varphi/} \\ \downarrow & \nearrow & \downarrow \\ N_\bullet(P_+) & \xrightarrow{\quad} & \mathcal{C}_{\varphi_0/}. \end{array}$$

This lifting problem admits a solution by virtue of our assumption that φ is a colimit diagram in \mathcal{C} . \square

8.1.6 Restricted Cospans

Let \mathcal{C} be an ∞ -category, and let $\text{Cospan}(\mathcal{C})$ be the simplicial set introduced in Construction 8.1.3.1. By definition, the edges of $\text{Cospan}(\mathcal{C})$ correspond to cospans in the ∞ -category \mathcal{C} : that is, pairs of morphisms $X \xrightarrow{f} B \xleftarrow{g} Y$ having a common target. In practice, it will sometimes be useful to consider a variant of this construction, where we place additional restrictions on the morphisms f and g .

Definition 8.1.6.1 (Restricted Cospans). Let \mathcal{C} be a simplicial set and let L and R be collections of edges of \mathcal{C} . We let $\text{Cospan}^{L,R}(\mathcal{C})$ denote the simplicial subset of $\text{Cospan}(\mathcal{C})$ whose n -simplices are given by diagrams $X : \text{Tw}(\Delta^n) \rightarrow \mathcal{C}$ which satisfy the following condition:

- For every pair of integers $0 \leq i \leq j \leq n$, the edge $X_{i,i} \rightarrow X_{i,j}$ belongs to L and the edge $X_{j,j} \rightarrow X_{i,j}$ belongs to R .

Remark 8.1.6.2 (Symmetry). Let \mathcal{C} be a simplicial set and let L and R be collections of edges of \mathcal{C} . Then the isomorphism $\text{Cospan}(\mathcal{C}) \xrightarrow{\sim} \text{Cospan}(\mathcal{C})^{\text{op}}$ of Remark 8.1.3.4 restricts to an isomorphism of simplicial subsets $\text{Cospan}^{L,R}(\mathcal{C}) \xrightarrow{\sim} \text{Cospan}^{R,L}(\mathcal{C})^{\text{op}}$.

Remark 8.1.6.3. Let \mathcal{C} be a simplicial set and let L and R be collections of edges of \mathcal{C} . Suppose we are given a morphism of simplicial sets $f : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$, corresponding to a morphism $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ (see Proposition 8.1.3.7). For every edge $e : X \rightarrow Y$ of \mathcal{D} , let $e_L : \text{id}_X \rightarrow e$ and $e_R : \text{id}_Y \rightarrow e$ be the edges of $\text{Tw}(\mathcal{D})$ described in Example 8.1.3.6. Then f factors through the simplicial subset $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if the edge $F(e_L)$ belongs to L and the edge $F(e_R)$ belongs to R , for every edge e of \mathcal{D} .

Remark 8.1.6.4. Let \mathcal{C} be a simplicial set, let L and R be collections of edges of \mathcal{C} , and let $\text{Cospan}^{L,R}(\mathcal{C})$ denote the restricted cospan construction of Definition 8.1.6.1. Note that a

morphism of simplicial sets $K \rightarrow \text{Cospan}(\mathcal{C})$ factors through $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if its restriction to the 1-skeleton $\text{sk}_1(K)$ factors through $\text{Cospan}^{L,R}(\mathcal{C})$. In particular, if σ is a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ which is thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$, then it is also thin when viewed as a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$. For a partial converse, see Corollary 8.1.6.8.

We now formulate a criterion which guarantees that the simplicial set $\text{Cospan}^{L,R}(\mathcal{C})$ is an $(\infty, 2)$ -category.

- 0494 **Definition 8.1.6.5.** Let \mathcal{C} be an ∞ -category and let L and R be collections of morphisms of \mathcal{C} . We will say that L and R are *pushout-compatible* if, for every morphism $f_0 : X \rightarrow X_0$ of \mathcal{C} which belongs to L and every morphism $f_1 : X \rightarrow X_1$ of \mathcal{C} which belongs to R , there exists a pushout diagram

$$\begin{array}{ccc} X & \xrightarrow{f_0} & X_0 \\ f_1 \downarrow & & \downarrow f'_1 \\ X_1 & \xrightarrow{f'_0} & X_{01} \end{array}$$

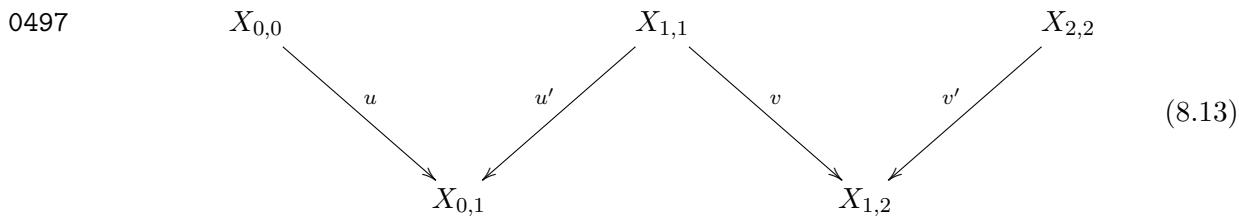

where f'_0 belongs to L and f'_1 belongs to R .

- 0495 **Example 8.1.6.6.** Let \mathcal{C} be an ∞ -category, let L be a collection of morphisms of \mathcal{C} , and let R be the collection of all isomorphisms in \mathcal{C} . Assume that L is stable under isomorphism (that is, if f is a morphism of \mathcal{C} which is isomorphic to an element of L in the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$, then f also belongs to L). Then L and R are pushout-compatible.

- 0496 **Proposition 8.1.6.7.** Let \mathcal{C} be an ∞ -category and let L and R denote collections of morphisms of \mathcal{C} which are closed under composition. If L and R are pushout-compatible (in the sense of Definition 8.1.6.5), then the simplicial set $\text{Cospan}^{L,R}(\mathcal{C})$ is an $(\infty, 2)$ -category.

Proof. We will show that $\text{Cospan}^{L,R}(\mathcal{C})$ satisfies each condition of Definition 5.5.1.3:

- (1) Let $\sigma_0 : \Lambda_1^2 \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets; we wish to show that σ_0 can be extended to a thin 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$. Let us identify σ_0 with a diagram

in the ∞ -category \mathcal{C} , where the morphisms u and v belong to L and the morphisms u' and v' belong to R . Combining our assumption that L and R are pushout-compatible with Lemma 8.1.4.4, we can enlarge (8.13) to a commutative diagram

$$\begin{array}{ccccc}
 X_{0,0} & & X_{1,1} & & X_{2,2} \\
 \searrow u & & \swarrow u' & \searrow v & \swarrow v' \\
 & X_{0,1} & & X_{1,2} & \\
 & \downarrow w & & \downarrow w' & \\
 & X_{0,2} & & &
 \end{array}$$

where w belongs to L , w' belongs to R , and the lower square is a pushout. By virtue of Proposition 8.1.4.2, this extension can be viewed as a thin 2-simplex of the simplicial set $\text{Cospan}(\mathcal{C})$. Using our assumption that L and R are closed under composition, we see that σ belongs to the simplicial subset $\text{Cospan}^{L,R}(\mathcal{C})$, and is therefore also thin when regarded as a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ (Remark 8.1.6.4).

- (2) Every degenerate 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ is thin; this follows from Corollary 8.1.4.3 and Remark 8.1.6.4.
- (3) Let $n \geq 3$ and let $\sigma_0 : \Lambda_0^n \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets with the property that the 2-simplex $\sigma_0|_{N_\bullet(\{0 < 1 < n\})}$ is left-degenerate. Using Lemma 8.1.4.7, we can extend σ_0 to an n -simplex σ of $\text{Cospan}(\mathcal{C})$. Since every edge of Δ^n is contained in Λ_0^n , the extension σ is automatically contained in $\text{Cospan}^{L,R}(\mathcal{C})$ (Remark 8.1.6.4).
- (4) Let $n \geq 3$ and let $\sigma_0 : \Lambda_n^n \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets with the property that the 2-simplex $\sigma_0|_{N_\bullet(\{0 < n-1 < n\})}$ is right-degenerate. Then σ_0 can be extended to an n -simplex of $\text{Cospan}^{L,R}(\mathcal{C})$; this follows by applying (3) to the opposite simplicial set $\text{Cospan}^{L,R}(\mathcal{C})^{\text{op}} \simeq \text{Cospan}^{R,L}(\mathcal{C})$ (see Remark 8.1.6.2).

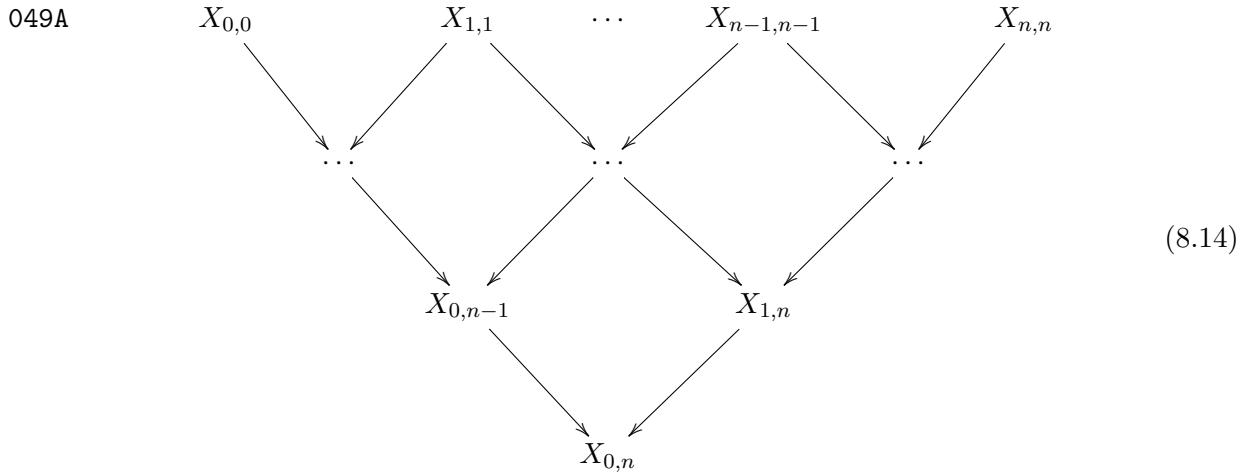

□

Corollary 8.1.6.8. *Let \mathcal{C} be an ∞ -category and let L and R denote collections of morphisms of \mathcal{C} which are closed under composition. If L and R are pushout-compatible, then a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ is thin if and only if it is thin when viewed as a 2-simplex of the simplicial set $\text{Cospan}(\mathcal{C})$.*

Proof. Let σ be a thin 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$; we will show that σ is also thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$ (the reverse implication follows from Remark 8.1.6.4). Choose a fully faithful functor $f : \mathcal{C} \rightarrow \mathcal{D}$, where \mathcal{D} is an ∞ -category which admits pushouts and the functor f preserves all pushout squares which exist in \mathcal{C} (see Corollary 8.3.3.17). Then f induces a morphism of simplicial sets $F : \text{Cospan}^{L,R}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$. The proof of Proposition 8.1.6.7 shows that every morphism $\tau_0 : \Lambda_1^2 \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ can be extended to a 2-simplex τ of $\text{Cospan}^{L,R}(\mathcal{C})$ which is thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$. Since f preserves pushout squares, the criterion of Proposition 8.1.4.2 guarantees that $F(\tau)$ is a thin 2-simplex of $\text{Cospan}(\mathcal{D})$. Allowing τ_0 to vary and invoking Proposition 5.5.7.9, we deduce that F is a functor of $(\infty, 2)$ -categories. In particular, $F(\sigma)$ is a thin 2-simplex of $\text{Cospan}(\mathcal{D})$. Using the criterion of Proposition 8.1.4.2 and the assumption that f is fully faithful, we deduce that σ is also thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$.

□

0499 **Remark 8.1.6.9.** In the situation of Proposition 8.1.6.7, let σ be an n -simplex of the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$, corresponding to a diagram

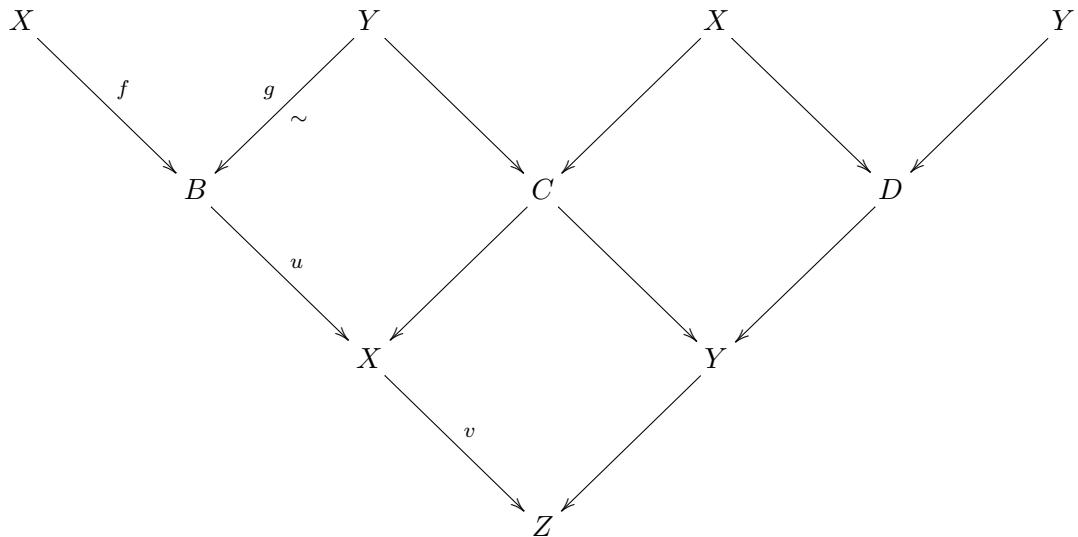

in the ∞ -category \mathcal{C} . Then σ is contained in the pith $\text{Pith}(\text{Cospan}^{L,R}(\mathcal{C}))$ if and only if each of the rectangular regions in the diagram (8.14) is a pushout square in the ∞ -category \mathcal{C} . This follows from the thinness criterion of Corollary 8.1.6.8 (together with Proposition 7.6.3.19).

049B **Corollary 8.1.6.10** (Invertible Cospans). *Let \mathcal{C} be an ∞ -category. Let L and R be collections of morphisms of \mathcal{C} which contain all isomorphisms and are closed under composition. Assume that L and R are pushout-compatible and let $e : X \rightarrow Y$ be a morphism in the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$, which we identify with a diagram $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category \mathcal{C} . Then e is an isomorphism in $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if f and g are isomorphisms in \mathcal{C} .*

Proof. Let \mathcal{C}^{\simeq} denote the core of \mathcal{C} (Construction 1.2.4.4). If f and g are isomorphisms, then e can be regarded as an edge of the simplicial set $\text{Cospan}(\mathcal{C}^{\simeq})$. Since \mathcal{C}^{\simeq} is a Kan complex (Corollary 4.4.3.11), the simplicial set $\text{Cospan}(\mathcal{C}^{\simeq})$ is also a Kan complex (Corollary 8.1.3.11), so e is automatically an isomorphism when viewed as a morphism of $\text{Cospan}(\mathcal{C}^{\simeq})$ (Proposition 1.3.6.10). Since the inclusion map $\text{Cospan}(\mathcal{C}^{\simeq}) \hookrightarrow \text{Cospan}^{L,R}(\mathcal{C})$ is a functor of $(\infty, 2)$ -categories (Corollary 8.1.6.8), it follows that e is also an isomorphism when regarded as a morphism of $\text{Cospan}^{L,R}(\mathcal{C})$ (Remark 5.5.7.5).

Now suppose that e is an isomorphism in the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$. Arguing as in the proof of Proposition 5.5.6.6, we can produce a 3-simplex $\sigma : \Delta^3 \rightarrow \text{Pith}(\text{Cospan}^{L,R}(\mathcal{C}))$, where $\sigma|_{N_0(\{0 < 1\})}$ is the morphism e , $\sigma|_{N_0(\{0 < 2\})}$ is the identity morphism id_X , and $\sigma|_{N_0(\{1 < 3\})}$ is the identity morphism id_Y . Let us identify σ with a diagram

in the ∞ -category \mathcal{C} . This diagram exhibits the identity morphism id_X as a composition of u with f . Since $\sigma|_{N_0(\{0 < 1 < 3\})}$ is a thin 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$, the outer rectangular region on the left is a pushout square in \mathcal{C} (Corollary 8.1.6.8). It follows that the composition of v with u is an isomorphism in \mathcal{C} (since it is a pushout of the identity morphism id_Y ; see Corollary 7.6.3.18). Applying the two-out-of-six property to the 3-simplex of \mathcal{C} given by the left edge of the diagram, we conclude that f is an isomorphism in \mathcal{C} (see Proposition 5.5.6.5). A similar argument shows that g is an isomorphism in \mathcal{C} . \square

Exercise 8.1.6.11. Show that, if the conditions of Corollary 8.1.6.10 are satisfied, then the diagram $Y \xrightarrow{g} B \xleftarrow{f} X$ is a homotopy inverse of e , when regarded as a morphism from Y to X in the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$.

Corollary 8.1.6.12. Let \mathcal{C} be an ∞ -category containing objects X and Y . Let L and R be collections of morphisms of \mathcal{C} which are pushout-compatible, contain all isomorphisms of \mathcal{C} ,

and are closed under composition. Then X and Y are isomorphic as objects of the ∞ -category \mathcal{C} if and only if they are isomorphic as objects of the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$.

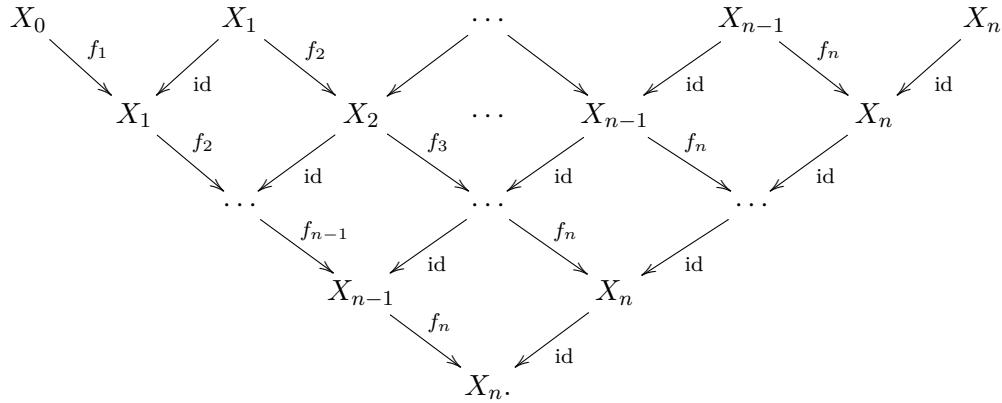

8.1.7 Comparing \mathcal{C} with $\text{Cospan}(\mathcal{C})$

049E Let \mathcal{C} be a category which admits pushouts. Then there is a functor from \mathcal{C} to the 2-category $\text{Cospan}(\mathcal{C})$ of Example 2.2.2.1, which carries each object of \mathcal{C} to itself and each morphism $f : X \rightarrow Y$ to the cospan $X \xrightarrow{f} Y \xleftarrow{\text{id}_Y} Y$. This observation has an ∞ -categorical counterpart:

049F **Construction 8.1.7.1.** Let \mathcal{C} be a simplicial set and let $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ be the projection map of Notation 8.1.1.6, carrying each vertex $(f : X \rightarrow Y)$ of $\text{Tw}(\mathcal{C})$ to the vertex $Y \in \mathcal{C}$. Under the bijection supplied by Proposition 8.1.3.7, we can identify λ_+ with a morphism of simplicial sets $\rho_+ : \mathcal{C} \rightarrow \text{Cospan}(\mathcal{C})$. If σ is an n -simplex of \mathcal{C} , which we display informally as a diagram

$$X_0 \xrightarrow{f_1} X_1 \xrightarrow{f_2} X_2 \rightarrow \cdots \xrightarrow{f_n} X_n,$$

then $\rho_+(\sigma)$ is an n -simplex of $\text{Cospan}(\mathcal{C})$ which can be depicted informally as a diagram

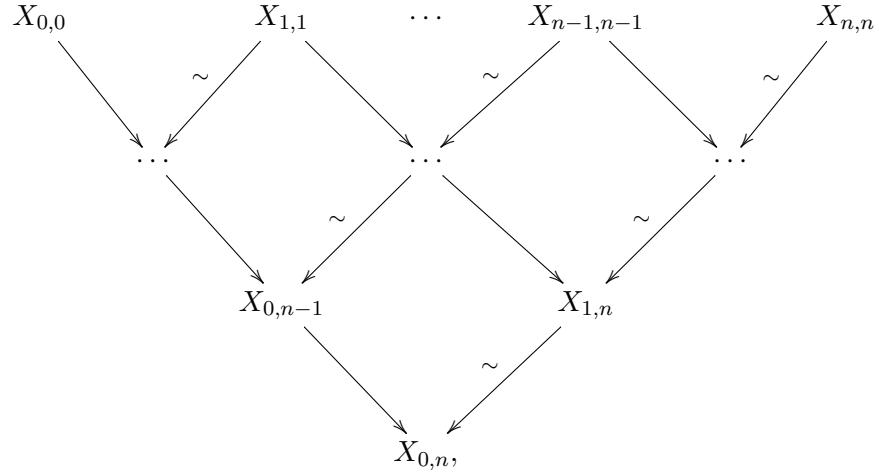

Note that ρ_+ is a monomorphism of simplicial sets.

Our goal in this section is to study the behavior of Construction 8.1.7.1 in the case where the simplicial set \mathcal{C} is an ∞ -category. In this case, we will show that ρ_+ induces an equivalence of \mathcal{C} with a certain restricted cospan construction (Proposition 8.1.7.6).

049G **Construction 8.1.7.2.** Let \mathcal{C} be an ∞ -category. We let $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ denote the simplicial

subset of $\text{Cospan}(\mathcal{C})$ whose n -simplices are diagrams

where each of the leftward-directed arrows is an isomorphism in \mathcal{C} .

Remark 8.1.7.3. Let \mathcal{C} be an ∞ -category. Then the simplicial set $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ of 049H Construction 8.1.7.2 coincides with the restricted cospan construction $\text{Cospan}^{L,R}(\mathcal{C})$ of Definition 8.1.6.1, where we take L to be the collection of all morphisms of \mathcal{C} and R to be the collection of all isomorphisms in \mathcal{C} (see Example 8.1.7.10 for a more general statement).

Variant 8.1.7.4. Let \mathcal{C} be a simplicial set and let R be a collection of edges of \mathcal{C} . We 049J let $\text{Cospan}^{\text{all},R}(\mathcal{C})$ denote the simplicial subset $\text{Cospan}^{A,R}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$, where A is the collection of all edges of \mathcal{C} . Similarly, if L is a collection of edges of \mathcal{C} , we let $\text{Cospan}^{L,\text{all}}(\mathcal{C})$ denote the simplicial subset $\text{Cospan}^{L,A}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$. Note that the simplicial set $\text{Cospan}^{L,R}(\mathcal{C})$ of Definition 8.1.6.1 can be recovered as the intersection $\text{Cospan}^{L,\text{all}}(\mathcal{C}) \cap \text{Cospan}^{\text{all},R}(\mathcal{C})$.

Proposition 8.1.7.5. Let \mathcal{C} be an ∞ -category. Then the simplicial set $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ is 049K an ∞ -category.

Proof. Let σ be a 2-simplex of $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$, which we identify with a diagram

$$\begin{array}{ccccc}
 X_{0,0} & & X_{1,1} & & X_{2,2} \\
 & \searrow & \swarrow \sim & \searrow & \swarrow \sim \\
 & & X_{0,1} & & X_{1,2} \\
 & \swarrow & \searrow \sim & & \\
 & & & & X_{0,2}
 \end{array}$$

in the ∞ -category \mathcal{C} where the leftward-directed morphisms are isomorphisms. Using Corollary 7.6.3.18, we deduce that the inner region is a pushout square in \mathcal{C} . It follows that σ is automatically thin when regarded as a 2-simplex of $\text{Cospan}(\mathcal{C})$ (Proposition 8.1.4.2), and therefore also when regarded as a 2-simplex of $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ (Remark 8.1.6.4). To complete the proof, it will suffice to show that every diagram $\Lambda_1^2 \rightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ can be extended to a 2-simplex of $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ (see Example 2.3.2.4). Using Lemma 8.1.4.4, we can restate this as follows: for every pair of morphisms $f : X_{1,1} \rightarrow X_{1,2}$ and $u : X_{1,1} \rightarrow X_{0,1}$ of \mathcal{C} where u is an isomorphism, there exists a commutative diagram

$$\begin{array}{ccc}
 & X_{1,1} & \\
 u \swarrow & \nearrow f & \searrow \\
 X_{0,1} & & X_{1,2} \\
 \swarrow & \searrow v & \\
 & X_{0,2} &
 \end{array}$$

where v is also an isomorphism. This follows immediately from the definitions (or from Corollary 4.4.5.9). \square

Let \mathcal{C} be an ∞ -category and let $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}(\mathcal{C})$ the morphism described in Construction 8.1.7.1. Note that ρ_+ carries each object of \mathcal{C} to itself, and each morphism $f : X \rightarrow Y$ of \mathcal{C} to the edge of $\text{Cospan}(\mathcal{C})$ given by the diagram $X \xrightarrow{f} Y \xleftarrow{\text{id}_Y}$. Since every identity morphism in \mathcal{C} is an isomorphism, ρ_+ factors through the ∞ -category $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$. The remainder of this section is devoted to the proof of the following:

Proposition 8.1.7.6. *Let \mathcal{C} be an ∞ -category. Then the functor $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ 049L is an equivalence of ∞ -categories.*

Example 8.1.7.7. Let X be a Kan complex. Applying Proposition 8.1.7.6 (and noting 049M that every edge of X is an isomorphism), we see that $\rho_+ : X \rightarrow \text{Cospan}(X)$ is a homotopy equivalence of Kan complexes (see Corollary 8.1.3.11).

Our proof of Proposition 8.1.7.6 will require some preliminaries.

Definition 8.1.7.8. Let \mathcal{C} be a simplicial set and let W be a collection of morphisms of 049N \mathcal{C} . We say that W has the left two-out-of-three property if, for every 2-simplex of \mathcal{C} with boundary indicated in by the diagram

$$\begin{array}{ccc} X & \xrightarrow{h} & Z \\ & \searrow f & \nearrow g \\ & Y & \end{array}$$

where f belongs to W , g belongs to W if and only if h belongs to W .

Lemma 8.1.7.9. *Let \mathcal{C} and \mathcal{D} be ∞ -categories and let $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ be a functor, 049P corresponding to a morphism of simplicial sets $f : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$. Let L and R be collections of morphisms of \mathcal{C} which satisfy the left two-out-of-three property. Then f factors through $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if F satisfies the following pair of conditions:*

- (1) *For each object X in \mathcal{D} , the morphism F carries every morphism of $\{X\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D})$ to a morphism of \mathcal{C} which belongs to L .*
- (2) *For each vertex Y in \mathcal{D} , the morphism F carries every morphism of $\text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{Y\}$ to a morphism of \mathcal{C} which belongs to R .*

Proof. For every morphism $e : X \rightarrow Y$ of \mathcal{D} , let $\text{id}_X \xrightarrow{e_L} e \xleftarrow{e_R} \text{id}_Y$ be the tautological cospan in $\text{Tw}(\mathcal{D})$ described in Example 8.1.3.6. By virtue of Remark 8.1.6.3, the morphism f factors through $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if it satisfies the following pair of conditions:

- (1') For every morphism $e : X \rightarrow Y$ of \mathcal{D} , the functor F carries e_L to a morphism of \mathcal{C} which belongs to L .
- (2') For every morphism $e : X \rightarrow Y$ of \mathcal{D} , the functor F carries e_R to a morphism of \mathcal{C} which belongs to R .

The implications $(1) \Rightarrow (1')$ and $(2) \Rightarrow (2')$ are immediate (if $e : X \rightarrow Y$ is any morphism of \mathcal{D} , then e_L is contained in the fiber $\{X\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D})$, and e_R is contained in $\text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{Y\}$). We will complete the proof by showing that $(1')$ implies (1) ; a similar argument shows that $(2')$ implies (2) .

Assume that condition $(1')$ is satisfied, let X be an object of \mathcal{D} , and let $u : X \rightarrow Y$ and $v : X \rightarrow Z$ be morphisms of \mathcal{D} . Suppose we are given a morphism $g : u \rightarrow v$ in the ∞ -category $\mathcal{E} = \{X\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D})$; we wish to show that $F(g)$ belongs to L . Since id_X is initial when viewed as an object of \mathcal{E} (Proposition 8.1.2.1), there is a 2-simplex of \mathcal{E} whose boundary is indicated in the diagram

$$\begin{array}{ccc} & \text{id}_X & \\ & \swarrow u_L \quad \searrow v_L & \\ u & \xrightarrow{g} & v. \end{array}$$

Assumption $(1')$ guarantees that $F(u_L)$ and $F(v_L)$ belong to L . Since L satisfies the left two-out-of-three property, it follows that $F(g)$ also belongs to L . \square

049Q **Example 8.1.7.10.** Let \mathcal{C} be an ∞ -category and let σ be an n -simplex of the simplicial set $\text{Cospan}(\mathcal{C})$, corresponding to a diagram

049R

$$\begin{array}{ccccccc} X_{0,0} & & X_{1,1} & \cdots & X_{n-1,n-1} & & X_{n,n} \\ \searrow & \swarrow & \searrow & \cdots & \searrow & \swarrow & \searrow \\ \cdots & & \cdots & & \cdots & & \cdots \\ \searrow & \swarrow & \searrow & & \searrow & \swarrow & \searrow \\ X_{0,n-1} & & & & X_{1,n} & & \\ \searrow & & & & \searrow & & \\ X_{0,n}. & & & & & & \end{array} \tag{8.15}$$

Let L and R be collections of morphisms of \mathcal{C} which contain all identity morphisms and have the left two-out-of-three property. Then σ belongs to $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if each of the rightward-pointing morphisms displayed in (8.15) belong to L , and each of the leftward-pointing morphisms displayed in (8.15) belong to R .

Remark 8.1.7.11. Let \mathcal{C} be an ∞ -category, let R be a collection of morphisms of \mathcal{C} which has the left two-out-of-three property, and let \mathcal{D} be a simplicial set. Suppose we are given a pair of morphisms $f, g : \mathcal{D} \rightarrow \text{Fun}^{\text{all}, R}(\mathcal{C})$, corresponding to diagrams $F, G : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$. If $\alpha : F \rightarrow G$ is a natural transformation of diagrams, then the following conditions are equivalent:

- (a) For every edge $u : D' \rightarrow D$ of \mathcal{D} , the morphism $\alpha_u : F(u) \rightarrow G(u)$ belongs to R .
- (b) For every degenerate edge $u : D \rightarrow D$ of \mathcal{D} , the morphism $\alpha_u : F(u) \rightarrow G(u)$ belongs to R .

The implication $(a) \Rightarrow (b)$ is immediate. To prove the reverse implication, let $u : D' \rightarrow D$ be an edge of \mathcal{D} and let $u_R : \text{id}_D \rightarrow u$ be the edge of $\text{Tw}(\mathcal{D})$ described in Example 8.1.3.6. Evaluating α on the morphism u_R , we obtain a commutative diagram

$$\begin{array}{ccc} F(\text{id}_D) & \xrightarrow{\alpha_{\text{id}_D}} & G(\text{id}_D) \\ \downarrow & & \downarrow \\ F(u) & \xrightarrow{\alpha_u} & G(u) \end{array}$$

in the ∞ -category \mathcal{C} , where the vertical maps belong to R by virtue of our assumption that f and g factor through $\text{Cospan}^{\text{all}, R}(\mathcal{C})$. Applying the left two-out-of-three property, we conclude that if the upper horizontal map belongs to R , then the lower horizontal map also belongs to R .

Lemma 8.1.7.12. Let \mathcal{C} be an ∞ -category, let L and R be collections of morphisms of \mathcal{C} which have the left two-out-of-three property, and let $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ denote the full subcategory of $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those objects which correspond to diagrams $\mathcal{D} \rightarrow \text{Cospan}^{L, R}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$. Let R' be the collection of morphisms in $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ which satisfy the equivalent conditions of Remark 8.1.7.11, and define L' similarly. Then the isomorphism $\text{Fun}(\mathcal{D}, \text{Cospan}(\mathcal{C})) \simeq \text{Cospan}(\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C}))$ of Remark 8.1.3.9 restricts to an isomorphism of simplicial subsets $\text{Fun}(\mathcal{D}, \text{Cospan}^{L, R}(\mathcal{C})) \simeq \text{Cospan}^{L', R'}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$.

Proof. Writing $\text{Cospan}^{L, R}(\mathcal{C})$ as the intersection $\text{Cospan}^{L, \text{all}}(\mathcal{C}) \cap \text{Cospan}^{\text{all}, R}(\mathcal{C})$ (see Variant 8.1.7.4), we can reduce to the case where either L or R is the collection of all morphisms of \mathcal{C} . Let us assume that L is the collection of all morphisms of \mathcal{C} , so that L' is the collection of all morphisms of $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$. Suppose we are given another simplicial set \mathcal{E} and a diagram $F : \text{Tw}(\mathcal{D}) \times \text{Tw}(\mathcal{E}) \rightarrow \mathcal{C}$. We can identify F with a morphism of simplicial sets $\mathcal{E} \rightarrow \text{Fun}(\mathcal{D}, \text{Cospan}(\mathcal{C}))$. By virtue of Remark 8.1.6.3, this morphism factors through the simplicial subset $\text{Fun}(\mathcal{D}, \text{Cospan}^{L, R}(\mathcal{C}))$ if and only if, for every edge $u : D' \rightarrow D$ of \mathcal{D} and every edge $v : E' \rightarrow E$ of \mathcal{E} , the morphism F satisfies the following condition:

- (1_{u,v}) Let $u_R : \text{id}_D \rightarrow u$ and $v_R : \text{id}_E \rightarrow v$ be the edges of $\text{Tw}(\mathcal{D})$ and $\text{Tw}(\mathcal{E})$ described in Example 8.1.3.6. Then the morphism $F(u_R, v_R)$ belongs to R .

Identifying F with a morphism $f : \mathcal{E} \rightarrow \text{Cospan}(\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C}))$, we see that f factors through $\text{Cospan}'(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$ if and only if it satisfies condition (1_{u,v}) whenever v is a degenerate edge of \mathcal{E} . Under this assumption, f factors through $\text{Cospan}^{L', R'}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$ if and only if, for every edge $u : D' \rightarrow D$ of \mathcal{D} and every edge $v : E' \rightarrow E$ of \mathcal{E} , the diagram F satisfies the following condition:

- (2_{u,v}) The morphism $F(\text{id}_u, v)$ belongs to R .

To complete the proof, it suffices to observe that if condition (1_{u, id_E}) is satisfied, then condition (1_{u,v}) is equivalent to condition (2_{u,v}). This follows by applying the left two-out-of-three property to the upper triangle appearing in the diagram

$$\begin{array}{ccc} F(\text{id}_D, \text{id}_E) & \xrightarrow{F(u_R, \text{id})} & F(u, \text{id}_E) \\ \downarrow F(\text{id}, v_R) & \searrow F(u_R, v_R) & \downarrow F(\text{id}_u, v_R) \\ F(\text{id}_D, v) & \xrightarrow{F(u_R, \text{id}_v)} & F(u, v). \end{array}$$

□

049U Lemma 8.1.7.13. *Let \mathcal{C} be an ∞ -category, let \mathcal{D} be a simplicial set, and suppose we are given a pair of diagrams $f, g : \mathcal{D} \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$, corresponding to diagrams $F, G : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$. The following conditions are equivalent:*

- (1) *The diagrams f and g are isomorphic when viewed as objects of the ∞ -category $\text{Fun}(\mathcal{D}, \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}))$.*
- (2) *The diagrams F and G are isomorphic when viewed as objects of the ∞ -category $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$.*

Proof. Let $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ denote the full subcategory of $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those functors $\text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ which correspond to diagrams $\mathcal{D} \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$. Lemma 8.1.7.12, identifies $\text{Fun}(\mathcal{D}, \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}))$ with the ∞ -category $\text{Cospan}^{\text{all}, \text{iso}}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$. We are therefore reduced to proving that F and G are isomorphic when viewed as objects of the ∞ -category $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ if and only if they are isomorphic when viewed as objects of the ∞ -category $\text{Cospan}^{\text{all}, \text{iso}}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$. This is a special case of Corollary 8.1.6.12. □

Proof of Proposition 8.1.7.6. Let \mathcal{C} be an ∞ -category. We wish to show that the comparison map $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$ of Construction 8.1.7.1. Let \mathcal{D} be a simplicial

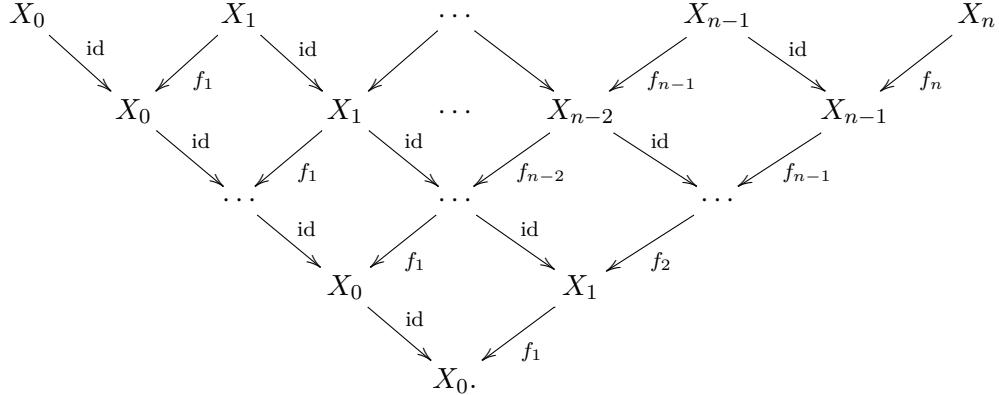

set; we will show that composition with ρ_+ induces a bijection $\theta : \pi_0(\text{Fun}(\mathcal{D}, \mathcal{C})^\simeq) \rightarrow \pi_0(\text{Fun}(\mathcal{D}, \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}))^\simeq)$.

Let $\lambda_+ : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}$ denote the projection map, and let W be the collection of all edges e of $\text{Tw}(\mathcal{D})$ such that $\lambda_+(e)$ is a degenerate edge of \mathcal{D} . Let $\text{Fun}(\text{Tw}(\mathcal{D})[W^{-1}], \mathcal{C})$ denote the full subcategory of $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those diagrams $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ which carry each edge of W to an isomorphism in \mathcal{C} (Notation 6.3.1.1). Using Lemmas 8.1.7.9 and 8.1.7.13, we can identify θ with the map $\pi_0(\text{Fun}(\mathcal{D}, \mathcal{C})^\simeq) \rightarrow \pi_0(\text{Fun}(\text{Tw}(\mathcal{D})[W^{-1}], \mathcal{C})^\simeq)$ given by composition λ_+ . To complete the proof, it will suffice to show that λ_+ exhibits \mathcal{D} as a localization of $\text{Tw}(\mathcal{D})$ with respect to W , in the sense of Definition 6.3.1.9. This follows from Corollary 6.3.6.4, since the morphism λ_+ is universally localizing (Corollary 8.1.2.4). \square

Variant 8.1.7.14. Let \mathcal{C} be a simplicial set. Then the projection map $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ 049V determines a morphism of simplicial sets $\rho_- : \mathcal{C}^{\text{op}} \rightarrow \text{Cospan}(\mathcal{C})$. If σ is an n -simplex of \mathcal{C}^{op} , which we display informally as a diagram

$$X_0 \xleftarrow{f_1} X_1 \xleftarrow{f_2} X_2 \leftarrow \cdots \xleftarrow{f_n} X_n,$$

then $\rho_-(\sigma)$ is an n -simplex of $\text{Cospan}(\mathcal{C})$ which is depicted informally by the diagram

If \mathcal{C} is an ∞ -category, then ρ_- restricts an equivalence $\mathcal{C}^{\text{op}} \hookrightarrow \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C})$, where $\text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C})$ is the simplicial subset $\text{Cospan}^{L, R}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$ where L is the collection of isomorphisms in \mathcal{C} , and R is the collection of all morphisms of \mathcal{C} .

8.1.8 Morphisms in the Duskin Nerve

Let S be a simplicial set. Recall that, for every pair of vertices $X, Y \in S$, the morphism 03KZ space $\text{Hom}_S(X, Y)$ is defined by the formula

$$\text{Hom}_S(X, Y) = \{X\} \tilde{\times}_S \{Y\} = \{X\} \times_{\text{Fun}(\{0\}, S)} \text{Fun}(\Delta^1, S) \times_{\text{Fun}(\{1\}, S)} \{Y\}.$$

In this section, we specialize to the case where $S = N_\bullet^D(\mathcal{C})$ is the Duskin nerve of a 2-category \mathcal{C} . In this case, we will see that there is close relationship between the simplicial set $\text{Hom}_S(X, Y)$ and the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ of 1-morphisms from X to Y . More precisely, we will construct a comparison map

$$\text{Cospan}(N_\bullet \underline{\text{Hom}}_{\mathcal{C}}(X, Y)) \rightarrow \text{Hom}_{N_\bullet^D(\mathcal{C})}(X, Y),$$

and show that it is an isomorphism of simplicial sets (Corollary 8.1.8.6).

03L0 Warning 8.1.8.1. Let \mathcal{C} be a 2-category. If every 2-morphism in \mathcal{C} is invertible, then the Duskin nerve $N_\bullet^D(\mathcal{C})$ is an ∞ -category (Theorem 2.3.2.1). It follows that, for every pair of objects $X, Y \in \mathcal{C}$, the simplicial set $\text{Hom}_{N_\bullet^D(\mathcal{C})}(X, Y)$ is a Kan complex. Beware that, in the case where \mathcal{C} contains non-invertible 2-morphisms, the simplicial set $\text{Hom}_{N_\bullet^D(\mathcal{C})}(X, Y)$ is generally not an ∞ -category (in fact, it is not even an $(\infty, 2)$ -category unless the category $\text{Hom}_{\mathcal{C}}(X, Y)$ admits pushouts: see Proposition 8.1.4.1). In such cases, it may be more useful to consider the *pinched* morphism spaces of $N_\bullet^D(\mathcal{C})$: see Example 4.6.5.12 and Remark 8.1.8.8.

01G9 Construction 8.1.8.2. Let \mathcal{A} be a category, let \mathcal{C} be a 2-category containing objects X and Y , and let $F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ be a functor. We define a strictly unitary lax functor $U_F : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ as follows:

- (1) The lax functor U_F is given on objects by $U_F(0, A) = X$ and $U_F(1, A) = Y$ for each object $A \in \mathcal{A}$.
- (2) Let $f : A \rightarrow B$ be a morphism in the category \mathcal{A} , which we also regard as an object of the twisted arrow category $\text{Tw}(\mathcal{A})$. For $0 \leq i \leq j \leq 1$, we let f_{ji} denote the corresponding morphism from (i, A) to (j, B) in the product category $[1] \times \mathcal{A}$. Then the lax functor U_F is given on 1-morphisms by the formula

$$U_F(f_{ji}) = \begin{cases} \text{id}_X & \text{if } i = j = 0 \\ \text{id}_Y & \text{if } i = j = 1 \\ F(f) & \text{if } 0 = i < j = 1. \end{cases}$$

- (3) Let $f : A \rightarrow B$ and $v : B \rightarrow C$ be composable morphisms in the category \mathcal{A} , and let $0 \leq i \leq j \leq k \leq 1$. Then the composition constraint $\mu_{g_{kj}, f_{ji}}$ for the lax functor U_F is given as follows:

- If $i = j = k = 0$, then $\mu_{g_{kj}, f_{ji}}$ is the unit constraint $v_X : \text{id}_X \circ \text{id}_X \xrightarrow{\sim} \text{id}_X$ of the 2-category \mathcal{C} .
- If $i = 0$ and $j = k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is given by the composition

$$\text{id}_Y \circ F(f) \xrightarrow{\lambda_{F(f)}} F(f) \xrightarrow{F(\text{id}_A, g)} F(g \circ f),$$

where $\lambda_{F(f)}$ is the left unit constraint of Construction 2.2.1.11 and we regard the pair (id_A, g) as an element of $\text{Hom}_{\text{Tw}(\mathcal{A})}(f, g \circ f)$.

- If $i = j = 0$ and $k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is given by the composition

$$F(g) \circ \text{id}_X \xrightarrow{\rho_{F(g)}} F(g) \xrightarrow{F(f, \text{id}_C)} F(g \circ f),$$

where $\rho_{F(g)}$ is the right unit constraint of Construction 2.2.1.11 and we regard the pair (f, id_C) as an element of $\text{Hom}_{\text{Tw}(\mathcal{A})}(g, g \circ f)$.

- If $i = j = k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is equal to the unit constraint $\nu_Y : \text{id}_Y \circ \text{id}_Y \xrightarrow{\sim} \text{id}_Y$ of the 2-category \mathcal{C} .

Exercise 8.1.8.3. Show that Construction 8.1.8.2 is well-defined. That is, given a functor 01GA $F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ as in Construction 8.1.8.2, show that there is a unique strictly unitary lax functor U_F satisfying properties (1), (2), and (3) of Construction 8.1.8.2.

We can now formulate the main result of this section.

Theorem 8.1.8.4. *Let \mathcal{A} be a category and let \mathcal{C} be a 2-category containing objects X and 01GB Y . Then the assignment $F \mapsto U_F$ of Construction 8.1.8.2 induces a monomorphism of sets*

$$\begin{array}{c} \{\text{Functors } F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)\} \\ \downarrow \\ \{\text{Strictly unitary lax functors } U : [1] \times \mathcal{A} \rightarrow \mathcal{C}\}. \end{array}$$

The image of this monomorphism consists of those strictly unitary lax functors $U : [1] \times \mathcal{C} \rightarrow \mathcal{D}$ having the property that $U|_{\{0\} \times \mathcal{A}}$ and $U|_{\{1\} \times \mathcal{A}}$ are the constant functors taking the values X and Y , respectively.

Remark 8.1.8.5. Let \mathcal{C} be a 2-category containing objects X and Y . For every category 03L1 \mathcal{A} , we can use Theorem 2.3.4.1 to identify strictly unitary lax functors $U : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ with morphisms of simplicial sets $G : \Delta^1 \times N_{\bullet}(\mathcal{A}) \rightarrow N_{\bullet}^D(\mathcal{C})$. Consequently, Theorem 8.1.8.4 supplies a bijection

$$\begin{array}{c} \{\text{Functors } F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)\} \\ \downarrow \sim \\ \{\text{Morphisms of simplicial sets } N_{\bullet}(\mathcal{A}) \rightarrow \text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y)\}. \end{array}$$

Note that the bijection of Remark 8.1.8.5 depends functorially on the simplicial set \mathcal{A} . Specializing to categories of the form $\mathcal{A} = [n]$, we obtain the following:

01GC **Corollary 8.1.8.6.** *Let \mathcal{C} be a 2-category containing objects X and Y . Then Construction 8.1.8.2 induces an isomorphism of simplicial sets*

$$\text{Cospan}(N_{\bullet}\underline{\text{Hom}}_{\mathcal{C}}(X, Y)) \xrightarrow{\sim} \text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y).$$

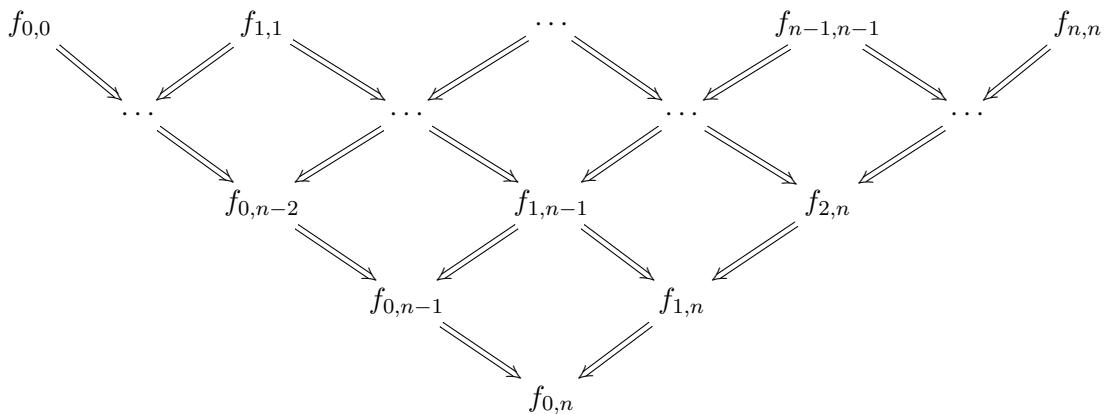

03L2 **Exercise 8.1.8.7.** Show that Theorem 8.1.8.4 follows from Corollary 8.1.8.6. In other words, to prove Theorem 8.1.8.4, there is no loss of generality in assuming that \mathcal{A} has the form $\{0 < 1 < \dots < n\}$ for some integer $n \geq 0$.

03L3 **Remark 8.1.8.8.** Let \mathcal{C} be a 2-category containing a pair of objects X and Y . Then we have a commutative diagram of simplicial sets

$$\begin{array}{ccccc} N_{\bullet}\underline{\text{Hom}}_{\mathcal{C}}(X, Y) & \xrightarrow{\rho_+} & \text{Cospan}(N_{\bullet}\underline{\text{Hom}}_{\mathcal{C}}(X, Y)) & \xleftarrow{\rho_-} & N_{\bullet}\underline{\text{Hom}}_{\mathcal{C}}(X, Y)^{\text{op}} \\ \downarrow \sim & & \downarrow \sim & & \downarrow \sim \\ \text{Hom}_{N_{\bullet}^D(\mathcal{C})}^L(X, Y) & \xrightarrow{\iota^L} & \text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y) & \xleftarrow{\iota^R} & \text{Hom}_{N_{\bullet}^D(\mathcal{C})}^R(X, Y) \end{array}$$

where the upper horizontal maps are the inclusions of Construction 8.1.7.1 and Variant 8.1.7.14, the lower horizontal maps are the pinch inclusion maps of Construction 4.6.5.6, the outer vertical maps are the isomorphisms of Example 4.6.5.12, and the inner vertical map is the isomorphism of Corollary 8.1.8.6.

Stated more concretely, Corollary 8.1.8.6 asserts that we can identify n -simplices of the simplicial set $\text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y)$ with commutative diagrams

in the category of 1-morphisms $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. The image of the left-pinch inclusion morphism

$$\iota^L : \text{Hom}_{N_{\bullet}^D(\mathcal{C})}^L(X, Y) \hookrightarrow \text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y)$$

consists of those simplices which correspond (under this identification) to commutative diagrams in which each of the leftward pointing 2-morphisms $f_{i,j} \Rightarrow f_{i-1,j}$ is an identity map. In this case, the entire diagram is determined by the sequence of composable morphisms $f_{0,0} \Rightarrow f_{0,1} \Rightarrow f_{0,2} \Rightarrow \cdots \Rightarrow f_{0,n}$ in the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. Similarly, the image of the right-pinch inclusion morphism

$$\iota^R : \text{Hom}_{N_{\bullet}^D(\mathcal{C})}^R(X, Y) \hookrightarrow \text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y)$$

consists of those simplices which correspond to commutative diagrams in which the rightward pointing 2-morphisms $f_{i,j} \Rightarrow f_{i,j+1}$ are identity maps, which ensures that the entire diagram is determined by the sequence of composable morphisms $f_{n,n} \Rightarrow f_{n-1,n} \Rightarrow f_{n-2,n} \Rightarrow \cdots \Rightarrow f_{0,n}$ in $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$.

Proof of Theorem 8.1.8.4. Let \mathcal{A} be an ordinary category, let \mathcal{C} be a 2-category containing objects X and Y , and let $U : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ be a strictly unitary lax functor having the property that $U|_{\{0\} \times \mathcal{A}}$ and $U|_{\{1\} \times \mathcal{A}}$ are the constant functors taking the values X and Y , respectively. We wish to show that there exists a unique functor of ordinary categories $F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ such that U is equal to the strictly unitary lax functor U_F given by Construction 8.1.8.2. To prove this, we may assume without loss of generality that the 2-category \mathcal{C} is strictly unitary (Proposition 2.2.7.7). Given a morphism $f : A \rightarrow B$ in the category \mathcal{A} and a pair of integers $0 \leq i \leq j \leq 1$, we write $f_{ji} : (i, A) \rightarrow (j, B)$ for the corresponding morphism in the product category $[1] \times \mathcal{A}$. Unwinding the definitions, we see that the identity $U = U_F$ imposes the following requirements on the functor F :

- (1) Let $f : A \rightarrow B$ be a morphism in the category \mathcal{C} , which we identify with an object of the twisted arrow category $\text{Tw}(\mathcal{A})$. Then $F(f)$ is equal to $U(f_{10}) \in \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$.
- (2) Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be composable morphisms in the category \mathcal{A} , and regard the pairs (id_A, g) and (f, id_C) as elements of $\text{Hom}_{\text{Tw}(\mathcal{A})}(f, g \circ f)$ and $\text{Hom}_{\text{Tw}(\mathcal{A})}(g, g \circ f)$, respectively. Then $F(\text{id}_A, g)$ and $F(f, \text{id}_C)$ are equal to the composition constraints $\mu_{g_{11}, f_{10}}$ and $\mu_{g_{10}, f_{00}}$ for the lax functor U , respectively.

We now establish the uniqueness of the functor F . The value of F on objects is determined by condition (1). If $f : A \rightarrow B$ and $f' : A' \rightarrow B'$ are objects of the twisted arrow category $\text{Tw}(\mathcal{A})$, then an element of $\text{Hom}_{\text{Tw}(\mathcal{A})}(f, f')$ can be identified with a pair (u, v) where $u \in \text{Hom}_{\mathcal{A}}(A', A)$ and $v \in \text{Hom}_{\mathcal{A}}(B, B')$ satisfy $f' = v \circ f \circ u$. In this case, the morphism (u, v) factors as a composition $(u, \text{id}_{B'}) \circ (\text{id}_A, v)$, so condition (2) guarantees the identity

$$F(u, v) = F(u, \text{id}_{B'}) \circ F(\text{id}_A, v) = \mu_{(vf)_{10}, u_{00}} \circ \mu_{v_{11}, f_{10}}.$$

This proves the uniqueness of F on morphisms.

To prove existence, we define the functor F on objects $f \in \text{Tw}(\mathcal{A})$ by setting $F(f) = U(f_{10})$, and on morphisms $(u, v) \in \text{Hom}_{\text{Tw}(\mathcal{A})}(f, f')$ by the formula

$$F(u, v) = \mu_{(vf)_{10}, u_{00}} \circ \mu_{v_{11}, f_{10}}.$$

Note that this prescription automatically satisfies condition (1). Since U is a strictly unitary functor between strictly unitary 2-categories, its composition constraints $\mu_{g,h}$ are the identity whenever either g or h is an identity morphism (Remark 2.2.7.5), which shows that F satisfies condition (2) and that it carries identity morphisms to identity morphisms. We will complete the proof by showing that F is compatible with composition. Let $f : A \rightarrow B$, $f' : A' \rightarrow B'$, and $f'' : A'' \rightarrow B''$ be objects of the twisted arrow category $\text{Tw}(\mathcal{A})$, and suppose we are given morphisms $(u, v) \in \text{Hom}_{\text{Tw}(\mathcal{A})}(f, f')$ and $(u', v') \in \text{Hom}_{\text{Tw}(\mathcal{A})}(f', f'')$. We wish to prove an equality $F(u \circ u', v' \circ v) = F(u', v') \circ F(u, v)$ of morphisms from $F(f)$ to $F(f'')$ in the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. Unwinding the definitions, this is equivalent to the commutativity of the outer cycle of the diagram

$$\begin{array}{ccccc}
 & & F(vfu) & & \\
 & \swarrow \mu_{(vf)_{10}, u_{00}} & & \searrow \mu_{v'_{11}, (vf)_{10}} & \\
 F(vf) & & F(v'vf) & & F(v'vfu) \\
 \swarrow \mu_{v_{11}, f_{10}} & \searrow \mu_{v'_{11}, (vf)_{10}} & \swarrow \mu_{(v'vf)_{10}, u_{00}} & \searrow \mu_{(v'vfu)_{10}, u'_{00}} & \\
 F(f) & \xrightarrow{\mu_{(v'v)_{11}, f_{10}}} & F(v'vf) & \xrightarrow{\mu_{(v'vf)_{10}, (uu')_{00}}} & F(v'vfuu')
 \end{array}$$

in the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. In fact, the entire diagram commutes. The commutativity of the upper square follows by applying property (c) of Definition 2.2.4.5 to the composable triple of morphisms

$$(0, A') \xrightarrow{u_{00}} (0, A) \xrightarrow{(vf)_{10}} (1, B') \xrightarrow{v'_{11}} (1, B'')$$

in the product category $[1] \times \mathcal{A}$. The commutativity of the lower left triangle follows by applying property (c) to the composable triple of morphisms

$$(0, A) \xrightarrow{f_{10}} (1, B) \xrightarrow{v_{11}} (1, B') \xrightarrow{v'_{11}} (1, B'')$$

and noting that the composition constraint $\mu_{v'_{11}, v_{11}}$ is equal to the identity (by virtue of our assumption that the lax functor $U|_{[1] \times \mathcal{A}}$ is constant). Similarly, the commutativity of the lower right triangle follows by applying (c) to the composable triple of morphisms

$$(0, A'') \xrightarrow{u'_{00}} (0, A') \xrightarrow{u_{00}} (0, A) \xrightarrow{(v'vf)_{10}} (1, B'')$$

and noting that the composition constraint $\mu_{u_{00}, u'_{00}}$ is equal to the identity (by virtue of our assumption that the lax functor $U|_{\{0\} \times \mathcal{A}}$ is constant). \square

8.1.9 Cospan Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Beware that the induced map $\text{Cospan}(U) : \text{Cospan}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$ is usually not an inner fibration. For example, in the special case $\mathcal{C} = \Delta^0$, the morphism U is an inner fibration if and only if \mathcal{E} is an ∞ -category. In this case, the simplicial set $\text{Cospan}(\mathcal{E})$ is usually not an ∞ -category (unless \mathcal{E} is a Kan complex). However, it contains an ∞ -category $\text{Cospan}^{\text{all,iso}}(\mathcal{E}) \subseteq \text{Cospan}(\mathcal{E})$ (Construction 8.1.7.2), which is canonically equivalent to the ∞ -category \mathcal{E} (Proposition 8.1.7.6). In this section, we describe a generalization which applies to any simplicial set \mathcal{C} . Our main result can be stated as follows:

Proposition 8.1.9.1. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets and let W denote the collection of all U -cocartesian edges of \mathcal{E} . Then the induced map $\text{Cospan}^{\text{all},W}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$ is an inner fibration of simplicial sets.*

We will give the proof of Proposition 8.1.9.1 at the end of this section.

Remark 8.1.9.2. In the situation of Proposition 8.1.9.1, let C be a vertex of \mathcal{C} and let \mathcal{E}_C denote the fiber $\{C\} \times_{\mathcal{C}} \mathcal{E}$. Note that a morphism u in the ∞ -category \mathcal{E}_C is an isomorphism if and only if it is U -cocartesian when viewed as a morphism in \mathcal{E} (Proposition 5.1.4.11). It follows that the fiber $\{C\} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{\text{all},W}(\mathcal{E})$ can be identified with the ∞ -category $\text{Cospan}^{\text{all,iso}}(\mathcal{E}_C)$. In particular, Proposition 8.1.7.6 supplies an equivalence of ∞ -categories

$$\rho_+ : \{C\} \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \{C\} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{\text{all},W}(\mathcal{E}).$$

Remark 8.1.9.3. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let W be the collection of all U -cocartesian morphisms of \mathcal{E} . Then we have a commutative diagram

$$\begin{array}{ccccc} \mathcal{E} & \longrightarrow & \text{Cospan}^{\text{all,iso}}(\mathcal{E}) & \longrightarrow & \text{Cospan}^{\text{all},W}(\mathcal{E}) \\ \downarrow U & & \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \text{Cospan}^{\text{all,iso}}(\mathcal{C}) & \longrightarrow & \text{Cospan}(\mathcal{C}), \end{array}$$

where the horizontal maps on the left are equivalences of ∞ -categories (Proposition 8.1.7.6), and the right half of the diagram is a pullback square (Proposition 5.1.1.8). It follows that from Proposition 8.1.9.1 that map $\text{Cospan}^{\text{all,iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$ is an inner fibration of ∞ -categories. In fact, it is even an isofibration: this follows easily from the

description of isomorphisms in the ∞ -categories $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ and $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{E})$ supplied by Corollary 8.1.6.10 (together with the fact that U is an isofibration; see Proposition 5.1.4.8). Applying Theorem 5.1.6.1 to the right side of the diagram, we conclude that the map $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ is also a cocartesian fibration of simplicial sets. Moreover, Corollary 4.5.2.24 guarantees that the induced map

$$\mathcal{E} \hookrightarrow \mathcal{C} \times_{\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})} \text{Cospan}^{\text{all},\text{iso}}(\mathcal{E}) \simeq \mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{\text{all},W}(\mathcal{E})$$

is an equivalence of ∞ -categories.

04FN **Remark 8.1.9.4.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let W be the collection of all U -cocartesian morphisms of \mathcal{E} . It follows from Proposition 8.1.9.1 that U also induces an inner fibration $\text{Cospan}^{W,\text{all}}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$, whose fiber over an object $C \in \mathcal{C}$ is equivalent to the *opposite* of the ∞ -category \mathcal{E}_C (see Variant 8.1.7.14). This construction will play an important role in §8.6.

For later use, it will be convenient to have a generalization of Proposition 8.1.9.1, where we impose some additional constraints on the cospans that we consider.

04A0 **Definition 8.1.9.5.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and let $\bar{f} : \bar{X} \rightarrow \bar{Y}$ be an edge of \mathcal{C} . We say that \bar{f} *admits U -cartesian lifts* if, for every vertex $Y \in \mathcal{E}$ satisfying $U(Y) = \bar{Y}$, there is a U -cartesian edge $f : X \rightarrow Y$ of \mathcal{E} satisfying $U(f) = \bar{f}$. We say that \bar{f} *admits U -cocartesian lifts* if, for every vertex $X \in \mathcal{E}$ satisfying $U(X) = \bar{X}$, there is a U -cocartesian edge $f : X \rightarrow Y$ of \mathcal{E} satisfying $U(f) = \bar{f}$.

04A1 **Remark 8.1.9.6.** In the situation of Definition 8.1.9.5, the edge \bar{f} admits U -cocartesian lifts if and only if it admits U^{op} -cartesian lifts, when regarded as an edge of the opposite simplicial set \mathcal{E}^{op} .

04A2 **Example 8.1.9.7.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Then U is a cocartesian fibration if and only if every edge of \mathcal{C} admits U -cocartesian lifts. Similarly, U is a cartesian fibration if and only if every edge of \mathcal{C} admits U -cartesian lifts.

04A3 **Example 8.1.9.8.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. The following conditions are equivalent:

- The morphism U is an isofibration of ∞ -categories.
- Every isomorphism of \mathcal{C} admits U -cocartesian lifts.
- Every isomorphism of \mathcal{C} admits U -cartesian lifts.

04A4 **Proposition 8.1.9.9.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets, let R be a collection of edges of \mathcal{C} which admits U -cocartesian lifts, and let \tilde{R} denote the collection of all U -cocartesian edges f of \mathcal{E} such that $U(f)$ belongs to \bar{R} . Then the induced map $\text{Cospan}^{\text{all},\tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all},R}(\mathcal{C})$ is an inner fibration of simplicial sets.

Proof. Replacing \mathcal{C} by a full simplicial subset if necessary, we may assume that R contains every degenerate edge of \mathcal{C} . Choose integers $0 < i < n$; we wish to show that every lifting problem

$$\begin{array}{ccc} \Lambda_i^n & \xrightarrow{f_0} & \text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E}) \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \Delta^n & \xrightarrow{\bar{f}} & \text{Cospan}^{\text{all}, R}(\mathcal{C}) \end{array} \quad \begin{matrix} 04A5 \\ (8.16) \end{matrix}$$

admits a solution. Using Proposition 8.1.3.7, we can rewrite (8.16) as a lifting problem

$$\begin{array}{ccc} \text{Tw}(\Lambda_i^n) & \xrightarrow{F_0} & \mathcal{E} \\ \downarrow & \nearrow F & \downarrow U \\ \text{Tw}(\Delta^n) & \xrightarrow{\bar{F}} & \mathcal{C}, \end{array}$$

where the morphism F is required to satisfy the following additional condition:

- (*) For every pair of integers $0 \leq i \leq j \leq n$, the morphism F carries $(j, j) \rightarrow (i, j)$ to a U -cocartesian edge of \mathcal{E} .

Replacing \mathcal{E} by the fiber product $\text{Tw}(\Delta^n) \times_{\mathcal{C}} \mathcal{E}$, we can reduce to the case where $\mathcal{C} = \text{Tw}(\Delta^n)$, and \bar{F} is the identity morphism. Since U is an inner fibration, it follows that \mathcal{E} is an ∞ -category.

Suppose first that $n \geq 3$. In this case, F_0 determines a commutative diagram

$$\begin{array}{ccc} F_0(i, i) & \longrightarrow & F_0(i-1, i) \\ \downarrow & & \downarrow \\ F_0(i, i+1) & \longrightarrow & F_0(i-1, i+1) \end{array} \quad \begin{matrix} 04A6 \\ (8.17) \end{matrix}$$

in the ∞ -category \mathcal{E} . Using our assumption that f_0 factors through $\text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E}) \subseteq \text{Cospan}(\mathcal{E})$ (together with Corollary 5.1.2.4), we deduce that the horizontal maps the diagram (8.17) are U -cocartesian. In particular, (8.17) is a U -colimit diagram (Proposition 7.6.3.17). Since the image of (8.17) in $\text{Tw}(\Delta^n)$ is a pushout square, it is a pushout diagram in \mathcal{E} (Corollary 7.1.5.15). Applying Proposition 8.1.4.2, we deduce that $f_0|_{N_{\bullet}(\{i-1 < i < i+1\})}$ is a thin 2-simplex of $\text{Cospan}(\mathcal{E})$, and therefore also of $\text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E})$ (Remark 8.1.6.4). It

follows that f_0 can be extended to an n -simplex σ of $\text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E})$, which we can identify with a functor $F : \text{Tw}(\Delta^n) \rightarrow \mathcal{E}$ satisfying condition $(*)$ and the identity $F|_{\text{Tw}(\Lambda_i^n)} = F_0$. The equality $U \circ F = \overline{F}$ is automatic, since $\text{Tw}(\Delta^n)$ is the nerve of a partially ordered set and $\text{Tw}(\Lambda_i^n)$ contains every vertex of $\text{Tw}(\Delta^n)$.

We now treat the case $n = 2$ (so that $i = 1$). In this case, we can identify F_0 with a diagram

$$X_{0,0} \xrightarrow{r} X_{0,1} \xleftarrow{u} X_{1,1} \xrightarrow{s} X_{1,2} \leftarrow vX_{2,2}$$

in the ∞ -category \mathcal{E} , where the morphisms u and v are U -cocartesian. Our assumption that \overline{f} factors through $\text{Cospan}^{\text{all}, R}(\mathcal{C})$ guarantees that the morphism $(2, 2) \rightarrow (0, 2)$ belongs to R . Since morphisms of R admit U -cocartesian lifts, we can choose a U -cocartesian morphism $w' : X_{2,2} \rightarrow X_{0,2}$ in \mathcal{E} , where $X_{0,2}$ belongs to the fiber over the object $(0, 2) \in \mathcal{C}$. Since v is also U -cocartesian, we can choose a 2-simplex σ_0 of \mathcal{E} with boundary indicated in the diagram

$$\begin{array}{ccc} X_{2,2} & \xrightarrow{w'} & X_{0,2} \\ & \searrow v & \swarrow w \\ & X_{1,2}. & \end{array}$$

Since \mathcal{E} is an ∞ -category, we can choose another 2-simplex σ_1 of \mathcal{E} with boundary indicated in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{q} & X_{0,2} \\ & \searrow s & \swarrow w' \\ & X_{1,2}. & \end{array}$$

Invoking our assumption that u is U -cocartesian, we can choose another 2-simplex σ_2 of \mathcal{E} with boundary indicated in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{q} & X_{0,2} \\ & \searrow u & \swarrow t \\ & X_{0,1}. & \end{array}$$

Using the fact that \mathcal{E} is an ∞ -category, we obtain another 2-simplex σ_3 of \mathcal{E} with boundary

indicated in the diagram

$$\begin{array}{ccc} X_{0,0} & \xrightarrow{\quad} & X_{0,2} \\ & \searrow^r & \nearrow t \\ & X_{0,1}. & \end{array}$$

The 2-simplices $\sigma_0, \sigma_1, \sigma_2$, and σ_3 determine a functor $F : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$ extending F_0 , which we display informally as a diagram

$$\begin{array}{ccccc} X_{0,0} & & X_{1,1} & & X_{2,2} \\ & \searrow^r & \nearrow^u & \searrow^s & \nearrow^v \\ & X_{0,1} & & X_{1,2} & \\ & & \searrow^t & \nearrow^w & \\ & & X_{0,2}. & & \end{array}$$

Since the morphism w' is U -cocartesian, the functor F satisfies condition $(*)$ and can therefore be viewed as a solution to the lifting problem (8.16). \square

Proof of Proposition 8.1.9.1. Combine Proposition 8.1.9.9 with Example 8.1.9.7. \square

Proposition 8.1.9.10. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories, let L and R be collections of morphisms of \mathcal{C} which are pushout-compatible, and assume that morphisms of R admit U -cocartesian lifts. Let \tilde{L} denote the collection of all morphisms f of \mathcal{E} such that $U(f) \in L$, and let \tilde{R} denote the collection of all U -cocartesian morphisms f of \mathcal{E} such that $U(f) \in R$. Then the collections \tilde{L} and \tilde{R} are also pushout-compatible.*

Proof. Let $f : X \rightarrow X_1$ be a morphism of \mathcal{E} which belongs to \tilde{L} , and let $g' : X \rightarrow X_0$ be a morphism of \mathcal{E} which belongs to \tilde{R} . We wish to show that there exists a pushout diagram

$$\begin{array}{ccc} X & \xrightarrow{g'} & X_0 \\ \downarrow f & & \downarrow f' \\ X_1 & \xrightarrow{g} & X_{01} \end{array} \quad \begin{array}{r} 04A8 \\ (8.18) \end{array}$$

in the ∞ -category \mathcal{E} , where f' belongs to \tilde{L} and g belongs to \tilde{R} . Since L and R are pushout compatible, there exists a pushout diagram

$$\begin{array}{ccc} \text{04A9} & U(X) & \xrightarrow{U(g')} U(X_0) \\ & \downarrow U(f) & \downarrow \bar{f}' \\ & U(X_1) & \xrightarrow{\bar{g}} \overline{X}_{01} \end{array} \quad (8.19)$$

in the ∞ -category \mathcal{C} , where \bar{f}' belongs to L and \bar{g} belongs to R . Our assumption on U guarantees that \bar{g} can be lifted to a U -cocartesian morphism $g : X_0 \rightarrow X_{01}$ of \mathcal{E} . Since U is an inner fibration, the lower left half of (8.19) can be lifted to a 2-simplex σ of \mathcal{E} which we display as a diagram

$$\begin{array}{ccc} X & & \\ \downarrow f & \searrow h & \\ X_1 & \xrightarrow{g} & X_{01}. \end{array}$$

Since g' is U -cocartesian, we can then lift the upper right half of (8.19) to a 2-simplex τ of \mathcal{E} which we display as a diagram

$$\begin{array}{ccc} X & \xrightarrow{g'} & X_0 \\ & \searrow h & \downarrow f' \\ & & X_{01}. \end{array}$$

Amalgamating σ and τ , we obtain a diagram of the form (8.18), where $f' \in \tilde{L}$ and $g \in \tilde{R}$. We will complete the proof by showing that this diagram is a pushout square in the ∞ -category \mathcal{E} . Since (8.19) is a pushout square in \mathcal{C} , it will suffice to show that 8.18 is a U -pushout square (Corollary 7.1.5.16). This is a special case of Proposition 7.6.3.17, since the horizontal morphisms appearing in the diagram are U -cocartesian. \square

04AA Remark 8.1.9.11. In the situation of Proposition 8.1.9.10, suppose that the collections L and R are closed under composition. Then \tilde{L} and \tilde{R} are also closed under composition (see Corollary 5.1.2.4). Applying Proposition 8.1.6.7, we deduce that the simplicial sets $\text{Cospan}^{L,R}(\mathcal{C})$ and $\text{Cospan}^{\tilde{L},\tilde{R}}(\mathcal{E})$ are $(\infty, 2)$ -categories. Moreover, it follows from the proof

of Proposition 8.1.9.10 that for every pushout diagram σ :

$$\begin{array}{ccc} X & \xrightarrow{g'} & X_0 \\ f \downarrow & & \downarrow f' \\ X_1 & \xrightarrow{g} & X_{01} \end{array}$$

in \mathcal{E} where f belongs to $\tilde{\mathcal{L}}$ and g belongs to $\tilde{\mathcal{R}}$, the image $U(\sigma)$ is a pushout diagram in \mathcal{C} . Combining this observation with Corollary 8.1.6.8 and Proposition 8.1.4.2, we see that a 2-simplex of $\text{Cospan}^{\tilde{\mathcal{L}}, \tilde{\mathcal{R}}}(\mathcal{E})$ is thin if and only if its image in $\text{Cospan}^{L, R}(\mathcal{C})$ is thin. In particular:

- The induced map $\bar{V} : \text{Cospan}^{\tilde{\mathcal{L}}, \tilde{\mathcal{R}}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$ is a functor of $(\infty, 2)$ -categories.
- The functor \bar{V} is an inner fibration (since it is a pullback of the inner fibration $\text{Cospan}^{\text{all}, \tilde{\mathcal{R}}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all}, R}(\mathcal{C})$ of Proposition 8.1.9.9).
- The underlying functor $V : \text{Pith}(\text{Cospan}^{\tilde{\mathcal{L}}, \tilde{\mathcal{R}}}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$ is also an inner fibration (since it is a pullback of \bar{V}).

8.1.10 Beck-Chevalley Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. For each object $C \in \mathcal{C}$, we let 04AB $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ denote the corresponding fiber of U . If U is a cartesian fibration, then every morphism $f : C \rightarrow B$ in \mathcal{C} determines a functor $f^* : \mathcal{E}_B \rightarrow \mathcal{E}_C$, given by contravariant transport along f (Definition 5.2.2.14). If U is a cocartesian fibration, then every morphism $f' : C' \rightarrow B$ determines a functor $f'_! : \mathcal{E}_{C'} \rightarrow \mathcal{E}_B$, given by covariant transport along f' (Definition 5.2.2.4). If both of these conditions are satisfied, then every cospan $C \xrightarrow{f} B \xleftarrow{f'} C'$ in \mathcal{C} determines a functor from $\mathcal{E}_{C'}$ to \mathcal{E}_C , given by the composition $f^* \circ f'_!$. Our goal in this section is to show that, under some mild assumptions, the construction $(f, f') \mapsto f^* \circ f'_!$ is compatible with the composition law on cospans, up to coherent homotopy. More precisely, we will show that this construction is given by contravariant transport for a certain cartesian fibration between cospan constructions (Theorem 8.1.10.3 and Remark 8.1.10.4). First, we need some terminology.

Definition 8.1.10.1. Let \mathcal{C} be an ∞ -category which admits pushouts. We will say that an 04AC inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is a *dual Beck-Chevalley fibration* if the following conditions are satisfied:

- (1) The morphism U is a cartesian fibration.

- (2) The morphism U is a cocartesian fibration.
- (3) Suppose we are given a morphism $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{E}$, which we display informally as a diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & X_0 \\ \downarrow g & & \downarrow g' \\ X_1 & \xrightarrow{f'} & X_{01}. \end{array}$$

Assume that f is U -cartesian, that g' is U -cocartesian, and that $U(\sigma)$ is a pushout square in \mathcal{C} . Then f' is U -cartesian if and only if g is U -cocartesian.

04AD Example 8.1.10.2. Let $\mathcal{E} = \text{Mod}(\text{Ab})$ denote the category of pairs (A, M) , where A is a commutative ring and M is an A -module (see Example 5.0.0.2). Let \mathcal{C} denote the category of commutative rings and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be the forgetful functor $(A, M) \mapsto A$. Then (the nerve of) U is a dual Beck-Chevalley fibration, in the sense of Definition 8.1.10.1. To see this, suppose we are given a commutative diagram σ :

$$\begin{array}{ccc} (A, M) & \xrightarrow{f} & (A_0, M_0) \\ \downarrow g & & \downarrow g' \\ (A_1, M_1) & \xrightarrow{f'} & (A_{01}, M_{01}) \end{array}$$

in the category \mathcal{E} . Then:

- The morphism f is U -cartesian if and only if the underlying map $M \rightarrow M_1$ is an isomorphism of A -modules.
- The morphism g' is U -cocartesian if and only if it exhibits M_{01} as obtained from M_1 by extending scalars along the ring homomorphism $A_1 \rightarrow A_{01}$: that is, if and only if it induces an isomorphism $A_{01} \otimes_{A_1} M_1 \rightarrow M_{01}$.
- The image of σ is a pushout diagram in \mathcal{C} if and only if the induced map $A_0 \otimes_A A_1 \rightarrow A_{01}$ is an isomorphism.

If all three of these conditions are satisfied, then the composite map $A_0 \otimes_A M \rightarrow M_0 \rightarrow M_{01}$ is an isomorphism. Using the two-out-of-three property, we conclude that f' is U -cartesian if and only if g is U -cocartesian.

We can now formulate our main result, which we prove at the end of this section.

Theorem 8.1.10.3. *Let \mathcal{C} be an ∞ -category which admits pushouts, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a 04AE dual Beck-Chevalley fibration and let R denote the collection of all U -cocartesian morphisms of \mathcal{E} . Then the map $\text{Cospan}(U) : \text{Cospan}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$ restricts to a cartesian fibration of ∞ -categories*

$$V : \text{Pith}(\text{Cospan}^{\text{all},R}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}(\mathcal{C})).$$

Moreover, a morphism of $\text{Pith}(\text{Cospan}^{\text{all},R}(\mathcal{E}))$ is V -cartesian if and only if it corresponds to a cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category \mathcal{E} , where f is U -cartesian and g is U -cocartesian.

Remark 8.1.10.4 (Contravariant Transport for Cospan Fibrations). In the situation 04AF of Theorem 8.1.10.3, let C and C' be objects of \mathcal{C} , so that Proposition 8.1.7.6 supplies equivalences of ∞ -categories

$$\rho_+^C : \mathcal{E}_C \hookrightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{E}_C) = V^{-1}\{C\} \quad \rho_+^{C'} : \mathcal{E}_{C'} \hookrightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{E}_{C'}) = V^{-1}\{C'\}.$$

Let e be a morphism from C to C' in the $(\infty, 2)$ -category $\text{Cospan}(\mathcal{C})$, which we identify with a pair of morphisms $C \xrightarrow{f} B \xleftarrow{f'} C'$ in the ∞ -category \mathcal{C} . Choose functors $f^* : \mathcal{E}_B \rightarrow \mathcal{E}_C$, $f'_! : \mathcal{E}_{C'} \rightarrow \mathcal{E}_B$ and diagrams

$$\begin{array}{ccccc} \Delta^1 \times \mathcal{E}_B & \xrightarrow{H} & \mathcal{E} & \xleftarrow{H'} & \Delta^1 \times \mathcal{E}_{C'} \\ \downarrow & & \downarrow U & & \downarrow \\ \Delta^1 & \xrightarrow{f} & \mathcal{C} & \xleftarrow{f'} & \Delta^1 \end{array}$$

which exhibit f^* and $f'_!$ as given by contravariant and covariant transport along f and f' , respectively (see Definitions 5.2.2.4 and 5.2.2.14). Then the composition

$$\begin{aligned} \text{Tw}(\Delta^1 \times \mathcal{E}_{C'}) &\simeq \text{Tw}(\Delta^1) \times \text{Tw}(\mathcal{E}_{C'}) \\ &\rightarrow \text{Tw}(\Delta^1) \times \mathcal{E}_{C'} \\ &\simeq (\text{N}_\bullet(\{(0,0) < (0,1)\}) \coprod_{\text{N}_\bullet(\{(0,1)\})} \text{N}_\bullet(\{(1,1) < (0,1)\})) \times \mathcal{E}_{C'} \\ &\xrightarrow{(H \circ (\text{id} \times f'_!), H')} \mathcal{E} \end{aligned}$$

can be identified with a functor $T : \Delta^1 \times \mathcal{E}_{C'} \rightarrow \text{Cospan}(\mathcal{E})$ which fits into a commutative diagram

$$\begin{array}{ccc} \Delta^1 \times \mathcal{E}_{C'} & \xrightarrow{T} & \text{Pith}(\text{Cospan}^{\text{all},W}(\mathcal{E})) \\ \downarrow & & \downarrow V \\ \Delta^1 & \xrightarrow{e} & \text{Pith}(\text{Cospan}(\mathcal{C})). \end{array}$$

For each object $X \in \mathcal{E}_{C'}$, the characterization of V -cartesian morphisms given in Theorem 8.1.10.3 shows that $T|_{\Delta^1 \times \{X\}}$ is a V -cartesian morphism of $\text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E}))$. It follows that the diagram

$$\begin{array}{ccccc} \mathcal{E}_{C'} & \xrightarrow{f'_!} & \mathcal{E}_B & \xrightarrow{f^*} & \mathcal{E}_C \\ \downarrow \rho_+^{C'} & & & & \downarrow \rho_+^C \\ V^{-1}\{C'\} & \xrightarrow{e^*} & V^{-1}\{C\} & & \end{array}$$

commutes up to homotopy, where the functor e^* is given by contravariant transport along e (for the cartesian fibration V).

04AG Corollary 8.1.10.5. *Let \mathcal{C} be an ∞ -category which admits pushouts, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration, let L be the collection of all U -cartesian morphisms of \mathcal{C} , and let R be the collection of all U -cocartesian morphisms of \mathcal{C} . Then $\text{Cospan}^{L, R}(\mathcal{E})$ is an $(\infty, 2)$ -category, and U induces a right fibration of ∞ -categories $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}(\mathcal{C}))$.*

Proof. The collections L and R are closed under composition (Corollary 5.1.2.4) and pushout-compatible by virtue of our assumption that U is a Beck-Chevalley fibration. Using Proposition 8.1.6.7, we see that $\text{Cospan}^{L, R}(\mathcal{E})$ is an $(\infty, 2)$ -category. Moreover, the pith of $\text{Cospan}^{L, R}(\mathcal{E})$ can be identified with the subcategory of $\text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E}))$ spanned by those morphisms which are cartesian with respect to the fibration $V : \text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}(\mathcal{C}))$ of Theorem 8.1.10.3. The desired result now follows from Corollary 5.1.4.15. \square

For later use, we will prove a more general form of Theorem 8.1.10.3, where we place some restrictions on the cospans under consideration. This will allow us to loosen the requirements of Definition 8.1.10.1.

04AH Definition 8.1.10.6. Let \mathcal{C} be an ∞ -category and let L and R be collections of morphisms of \mathcal{C} which are pushout-compatible (Definition 8.1.6.5). We will say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is a *dual Beck-Chevalley fibration relative to (L, R)* if the following conditions are satisfied:

- (1) Every morphism of \mathcal{C} which belongs to L admits U -cartesian lifts (Definition 8.1.9.5).
- (2) Every morphism of \mathcal{C} which belongs to R admits U -cocartesian lifts.
- (3) Suppose we are given a morphism $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{E}$, which we display informally as a

diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & X_0 \\ \downarrow g & & \downarrow g' \\ X_1 & \xrightarrow{f'} & X_{01}. \end{array}$$

Assume that f is U -cartesian, that g is U -cocartesian, that $U(f)$ belongs to L , that $U(g)$ belongs to R , and that $U(\sigma)$ is a pushout square in \mathcal{C} . Then f' is U -cartesian if and only if g is U -cocartesian.

Example 8.1.10.7. Let \mathcal{C} be an ∞ -category which admits pushouts and let A denote the 04AJ collection of all morphisms of \mathcal{C} . Then an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is a dual Beck-Chevalley fibration (in the sense of Definition 8.1.10.6) if and only if it is a dual Beck-Chevalley fibration relative to (A, A) (in the sense of Definition 8.1.10.6).

Example 8.1.10.8. In the situation of Definition 8.1.10.6, suppose that L is the collection 04AK of all isomorphisms in \mathcal{C} . Then condition (1) is equivalent to the requirement that U is an isofibration (Example 8.1.9.8), and condition (3) is automatic. Similarly, if R is the collection of all isomorphisms in \mathcal{C} , then condition (2) is the requirement that U is an isofibration, and condition (3) is automatic.

Theorem 8.1.10.9. Let \mathcal{C} be an ∞ -category, let L and R be collections of morphisms of 04AL \mathcal{C} which are closed under composition and pushout-compatible. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration with respect to (L, R) and define \tilde{L} and \tilde{R} as in Proposition 8.1.9.10. Then the functor $V : \text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$ of Remark 8.1.9.11 is a cartesian fibration of ∞ -categories. Moreover, a morphism e of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is V -cartesian if and only if it satisfies the following condition:

- (*) The morphism e corresponds to a cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category \mathcal{E} , where f is U -cartesian and g is U -cocartesian.

Proof. Let us say that a morphism e of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is *special* if it satisfies condition (*). We first show that every special morphism e of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is V -cartesian. Suppose we are given an integer $n \geq 2$ and a lifting problem

$$\begin{array}{ccc} \Lambda_n^n & \xrightarrow{h_0} & \text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \\ \downarrow & \nearrow h & \downarrow U' \\ \Delta^n & \xrightarrow{\bar{h}} & \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C})), \end{array} \quad \begin{array}{r} 04AM \\ (8.20) \end{array}$$

where the composition

$$\Delta^1 \simeq N_\bullet(\{n-1 < n\}) \subseteq \Lambda_n^n \xrightarrow{h_0} \text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$$

coincides with the edge e ; we wish to show that (8.20) admits a solution. Let us identify \bar{h} with a diagram $\bar{F} : \text{Tw}(\Delta^n) \rightarrow \mathcal{E}$ and h_0 with a diagram $H_0 : \text{Tw}(\Lambda_n^n) \rightarrow \mathcal{C}$ satisfying $U \circ H_0 = \bar{H}|_{\text{Tw}(\Lambda_n^n)}$. We first treat the case $n = 2$. In this case, we can identify F_0 with a pair of cospans

$$X_{0,0} \xrightarrow{f'} X_{0,2} \xleftarrow{g'} X_{2,2} \quad X_{1,1} \xrightarrow{f} X_{1,2} \xleftarrow{g} X_{2,2}$$

in the ∞ -category \mathcal{E} , where $f, f' \in \tilde{L}$ and $g, g' \in \tilde{R}$. Since g is U -cocartesian, we can lift $\bar{H}((2, 2) \rightarrow (1, 2) \rightarrow (0, 2))$ to a 2-simplex σ_0 of \mathcal{E} whose boundary we display in the diagram

$$\begin{array}{ccc} X_{2,2} & \xrightarrow{g'} & X_{0,2} \\ & \searrow g & \nearrow g'' \\ & X_{1,2}. & \end{array}$$

Since g and g' are U -cocartesian by assumption, Corollary 5.1.2.4 guarantees that g'' is also U -cocartesian. Since U is an inner fibration, we can lift $\bar{H}((1, 1) \rightarrow (1, 2) \rightarrow (0, 2))$ to a 2-simplex σ_1 of \mathcal{E} , whose boundary we display in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{s} & X_{0,2} \\ & \searrow f & \nearrow g'' \\ & X_{1,2}. & \end{array}$$

Since morphisms of R admit U -cocartesian lifts, we can lift $\bar{H}((1, 1) \rightarrow (0, 1) \rightarrow (0, 2))$ to a 2-simplex σ_2 of \mathcal{E} displayed in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{s} & X_{0,2} \\ & \searrow g''' & \nearrow f'' \\ & X_{0,1}, & \end{array}$$

where g''' is U -cocartesian. Applying condition (3) of Definition 8.1.10.6 to the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{f} & X_{1,2} \\ \downarrow g''' & & \downarrow g'' \\ X_{0,1} & \xrightarrow{f''} & X_{0,2}, \end{array}$$

we deduce that the morphism f'' is U -cartesian. We can therefore lift $\overline{H}((0,0) \rightarrow (0,1) \rightarrow (0,2))$ to a 2-simplex σ_3 of \mathcal{E} which we display as a diagram

$$\begin{array}{ccc} X_{0,0} & \xrightarrow{f'} & X_{0,2} \\ & \searrow f''' & \nearrow f'' \\ & X_{0,1}, & \end{array}$$

The 2-simplices $\sigma_0, \sigma_1, \sigma_2$, and σ_3 can then be amalgamed into a functor $H : \text{Tw}(\Delta^2) \rightarrow \mathcal{E}$ which we display informally as a diagram

$$\begin{array}{ccccc} X_{0,0} & & X_{1,1} & & X_{2,2} \\ & \searrow f''' & \nearrow g''' & \searrow f & \nearrow g \\ & X_{0,1} & & X_{1,2} & \\ & \searrow f'' & \nearrow g'' & & \end{array}$$

which is a solution to the lifting problem (8.20).

We now treat the case $n \geq 3$. By virtue of Lemma 8.1.4.6, it will suffice to show that the following conditions are satisfied:

- (a) The functor F_0 carries the edge $(n,n) \rightarrow (n-1,n)$ of $\text{Tw}(\Lambda_n^n)$ to a U -cocartesian edge of \mathcal{E} .
- (b) The functor F_0 carries the edge $(0,n-1) \rightarrow (0,n)$ of $\text{Tw}(\Lambda_n^n)$ to a U -cartesian edge of \mathcal{E} .

Assertion (a) follows immediately from our requirement that f_0 factors through $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$. To prove (b), we observe that F_0 determines a commutative diagram τ :

$$\begin{array}{ccc} F_0(n-1, n-1) & \xrightarrow{f} & F_0(n-1, n) \\ \downarrow g & & \downarrow g' \\ F_0(0, n-1) & \xrightarrow{f'} & F_0(0, n) \end{array}$$

in the ∞ -category \mathcal{E} , where $f \in \tilde{L}$ and $g \in \tilde{R}$. Our assumption that e is special guarantees that f is U -cartesian, and our assumption that \bar{h} factors through the pith of $\text{Cospan}^{L, R}(\mathcal{C})$ guarantees that $U(\tau)$ is a pushout diagram in \mathcal{C} . Applying Corollary 5.1.2.4 to the diagram

$$\begin{array}{ccc} F_0(n, n) & \xrightarrow{\quad} & F_0(0, n) \\ & \searrow & \nearrow g' \\ & F_0(n-1, n), & \end{array}$$

we see that g' is U -cocartesian. Condition (3) of Definition 8.1.10.6 then guarantees that f' is U -cartesian, as desired. This completes the proof that every special morphism of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is V -cartesian.

It follows from Remark 8.1.9.11 that V is an inner fibration of ∞ -categories. To show that V is a cartesian fibration, it will suffice to show that for every object $Y \in \mathcal{E}$ and every morphism $\bar{e} : \bar{X} \rightarrow U(Y)$ in the ∞ -category $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$, there exists a special morphism $e : X \rightarrow Y$ in $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$ satisfying $V(e) = \bar{e}$. Let us identify \bar{e} with a cospan $\bar{X} \xrightarrow{\bar{f}} \bar{B} \xleftarrow{\bar{g}} U(Y)$ in the ∞ -category \mathcal{C} . Then \bar{g} belongs to R , and can therefore be lifted to a U -cocartesian morphism $g : Y \rightarrow B$ in the ∞ -category \mathcal{E} . Since \bar{f} belongs to L , it can be lifted to a U -cartesian morphism $f : X \rightarrow B$ in the ∞ -category \mathcal{E} . The cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ then determines a special morphism $e : X \rightarrow Y$ of $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$ satisfying $V(e) = \bar{e}$.

We now complete the proof of Theorem 8.1.10.3 by showing that every V -cartesian morphism $e : X \rightarrow Y$ of $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$ is special. Let \bar{e} denote the image of e in $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$. Arguing as above, we can lift \bar{e} to a special morphism $e' : X' \rightarrow Y$ of $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$. Then e' is also V -cartesian. Applying Remark 5.1.3.8, we can choose a 2-simplex σ of $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$ which exhibits e as the composition of e' with

an isomorphism in the ∞ -category $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$. Let us identify σ with a diagram

$$\begin{array}{ccccc}
X & & X' & & Y \\
\searrow u & & \downarrow v & \searrow f & \\
& X'' & & B' & \\
& \downarrow f' & & \downarrow w & \\
& & B & &
\end{array}$$

in the ∞ -category \mathcal{E} . Corollary 8.1.6.10 implies that u and v are isomorphisms in \mathcal{E} . Since the inner region is a pushout diagram in \mathcal{E} , it follows that w is also an isomorphism (Corollary 7.6.3.18). Our assumption that e' is special guarantees that f is U -cartesian. Applying Corollary 5.1.2.5, we deduce that f' is U -cartesian. It follows that any composition of f' with u is U -cartesian (Corollary 5.1.2.4), so that the morphism e is also special. \square

Proof of Theorem 8.1.10.3. Apply Theorem 8.1.10.9 in the special case $L = A = R$, where A is the collection of all morphisms in the ∞ -category \mathcal{C} (Example 8.1.10.7). \square

Remark 8.1.10.10. In the situation of Theorem 8.1.10.9, the morphism

04AN

$$\overline{V} : \text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$$

is a locally cartesian fibration. To prove this, we observe that Remark 8.1.9.11 guarantees that \overline{V} is an inner fibration of $(\infty, 2)$ -categories and that the diagram

$$\begin{array}{ccc}
\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) & \longrightarrow & \text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \\
\downarrow V & & \downarrow \overline{V} \\
\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C})) & \longrightarrow & \text{Cospan}^{L, R}(\mathcal{C})
\end{array}$$

is a pullback square. Since every morphism of $\text{Cospan}^{L, R}(\mathcal{C})$ is contained in the pith $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$, the desired result follows from Theorem 8.1.10.9 (see Remark 5.1.5.6).

Remark 8.1.10.11. In the situation of Theorem 8.1.10.9, suppose that $\text{Cospan}^{L, R}(\mathcal{C})$ is an ∞ -category (this condition is satisfied, for example, if either L or R consists of isomorphisms; see Proposition 8.1.7.5). Then every 2-simplex of $\text{Cospan}^{L, R}(\mathcal{C})$ is thin. Applying Remark 8.1.9.11, we deduce that every 2-simplex of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is thin, so that $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is also an ∞ -category (Example 2.3.2.4). In this case, Theorem 8.1.10.9 asserts that the projection map $V : \text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$ is a cartesian fibration.

04AP

We also have the following variant of Corollary 8.1.10.5:

04AQ **Corollary 8.1.10.12.** *Let \mathcal{C} be an ∞ -category, let L and R be collections of morphisms of \mathcal{C} which are closed under composition and pushout-compatible. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration with respect to (L, R) , let \tilde{L} denote the collection of all U -cartesian morphisms f of \mathcal{E} such that $U(f) \in L$, and let \tilde{R} denote the collection of all U -cocartesian morphisms f of \mathcal{E} such that $U(f) \in R$. Then:*

- (1) *The simplicial set $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is an $(\infty, 2)$ -category.*
- (2) *The morphism U induces a right fibration $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$.*
- (3) *If $\text{Cospan}^{L, R}(\mathcal{C})$ is an ∞ -category, then $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is an ∞ -category, and U induces a right fibration $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$.*

04AR **Example 8.1.10.13.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories and let L and R be collections of morphisms of \mathcal{C} which are closed under composition and pushout-compatible. Assume that the following conditions are satisfied:

- (0) Let $f : X \rightarrow Y$ be a morphism of \mathcal{E} . If $U(f)$ belongs to L , then f is U -cartesian. If $U(f)$ belongs to R , then f is U -cocartesian.
- (1) For every object $Y \in \mathcal{E}$ and every morphism $\bar{f} : \bar{X} \rightarrow U(Y)$ of \mathcal{C} which belongs to L , there exists a morphism $f : X \rightarrow Y$ of \mathcal{E} satisfying $U(f) = \bar{f}$.
- (2) For every object $X \in \mathcal{E}$ and every morphism $\bar{f} : U(X) \rightarrow \bar{Y}$ of \mathcal{C} which belongs to R , there exists a morphism $f : X \rightarrow Y$ of \mathcal{E} satisfying $U(f) = \bar{f}$.

Then U is a dual Beck-Chevalley fibration relative to (L, R) . Applying Remark 8.1.10.10, we deduce that the projection map

$$V : \text{Cospan}(\mathcal{E}) \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{L, R}(\mathcal{C}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$$

is a locally cartesian fibration. Corollary 8.1.10.12 guarantees that each fiber of V is a Kan complex, so that V is a right fibration (Corollary 5.1.5.12).

8.2 Couplings of ∞ -Categories

043P We now axiomatize an essential feature of the twisted arrow construction introduced in §8.1.

043Q **Definition 8.2.0.1.** Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. A *coupling of \mathcal{C}_+ with \mathcal{C}_-* is an ∞ -category \mathcal{C} equipped with a left fibration $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$.

In the situation of Definition 8.2.0.1, we will often refer to the functor $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ as a *coupling of ∞ -categories*. This terminology signifies both that λ is a left fibration and that its target is equipped with a *specified* factorization as a product of ∞ -categories $\mathcal{C}_-^{\text{op}}$ and \mathcal{C}_+ .

Example 8.2.0.2 (The Twisted Arrow Coupling). Let \mathcal{C} be an ∞ -category. Then the map 043R $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Notation 8.1.1.6 is a coupling of \mathcal{C} with itself (Proposition 8.1.1.11). We will refer to λ as the *twisted arrow coupling* of the ∞ -category \mathcal{C} .

Construction 8.2.0.3. Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories. Pulling back 043S the left fibration $\text{Tw}(\mathcal{C}_-) \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-$ of Proposition 8.1.1.11, we obtain a left fibration of ∞ -categories

$$\lambda_G : \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+ \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+,$$

which we regard as a coupling of \mathcal{C}_+ with \mathcal{C}_- . We will refer to λ_G as the *coupling associated to the functor* G .

We say that a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is *representable* if, for every object $C_+ \in \mathcal{C}_+$, the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$ has an initial object (Definition 8.2.1.3). It is not difficult to show that, for every functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, the coupling λ_G of Construction 8.2.0.3 is representable (Variant 8.2.1.6). Our primary goal in this section is to prove the converse:

Theorem 8.2.0.4. *Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. Then the assignment $G \mapsto \lambda_G$ of Construction 8.2.0.3 induces a bijection*

$$\begin{array}{ccc} \{\text{Functors } G : \mathcal{C}_+ \rightarrow \mathcal{C}_-\}/\text{Isomorphism} & & \\ \downarrow & & \\ \{\text{Representable couplings } \lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+\}/\text{Equivalence.} & & \end{array}$$

Remark 8.2.0.5. Let \mathcal{C}_- be a (locally small) ∞ -category. For every ∞ -category \mathcal{C}_+ , Corollary 5.7.0.6 supplies an identification of equivalence classes of couplings $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ (having essentially small fibers) with isomorphism classes of functors $T : \mathcal{C}_+ \rightarrow \text{Fun}(\mathcal{C}_-^{\text{op}}, \mathcal{S})$. Moreover, λ is representable if and only if T factors through the full subcategory $\text{Fun}^{\text{rep}}(\mathcal{C}_-^{\text{op}}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}_-^{\text{op}}, \mathcal{S})$ spanned by the representable functors (see Proposition 5.7.6.21). Consequently, Theorem 8.2.0.4 supplies a bijection

$$\text{Hom}_{\text{hQCat}}(\mathcal{C}_+, \mathcal{C}_-) \xrightarrow{\sim} \text{Hom}_{\text{hQCat}}(\mathcal{C}_+, \text{Fun}^{\text{rep}}(\mathcal{C}_-^{\text{op}}, \mathcal{S})).$$

It is not hard to see that this bijection depends functorially on \mathcal{C}_+ , and is therefore induced by an isomorphism $\mathcal{C}_- \simeq \text{Fun}^{\text{rep}}(\mathcal{C}_-^{\text{op}}, \mathcal{S})$ in the homotopy category hQCat . We can therefore

regard Theorem 8.2.0.4 as an “implicit” version of Yoneda’s lemma. We will give a more precise formulation in §8.3 (see Theorem 8.3.3.13).

Let us outline our approach to Theorem 8.2.0.4. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. For a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, we say that λ is *representable by G* if it is equivalent to the coupling λ_G of Construction 8.2.0.3 (Definition 8.2.3.1). Theorem 8.2.0.4 asserts that every representable coupling is representable by some functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, which is uniquely determined up to isomorphism. To prove this, we need to construct a commutative diagram

043V

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- \end{array} \quad (8.21)$$

which is a categorical pullback square; in this case, we say that (8.21) *exhibits λ as represented by G* (Definition 8.2.3.5).

It will be useful to place this problem in a somewhat larger context. Suppose that $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ is another coupling of ∞ -categories. We will refer to a commutative diagram

043W

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array} \quad (8.22)$$

as a *morphism of couplings* from λ to μ (Definition 8.2.2.1). The collection of such diagrams can be organized into an ∞ -category $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$, which is equipped with a forgetful functor

$$\Phi : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

It is not difficult to see that Φ is also a left fibration: that is, it can be regarded as a coupling of the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$ with the ∞ -category $\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)$ (Proposition 8.2.2.2). Suppose now that the coupling λ is representable, and that the coupling μ is corepresentable (that is, for every object $D_- \in \mathcal{D}_-$, the ∞ -category $\{D_-\} \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ has an initial object). In §8.2.2, we show these assumptions imply that the coupling Φ is also corepresentable (Theorem 8.2.2.11). In particular, every functor $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ has a canonical promotion to a commutative diagram of the form (8.22), which is characterized (up to isomorphism) by the requirement that it represents an initial object of the ∞ -category

$\{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. In §8.2.3, we specialize this assertion to the situation where μ is the twisted arrow coupling $\text{Tw}(\mathcal{C}_-) \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and F_- is the identity functor from \mathcal{C}_- to itself. In this case, we obtain a diagram of the form (8.21) and use it to deduce Theorem 8.2.0.4.

Every assertion in the preceding discussion has a dual counterpart, where the assumption of representability is replaced by corepresentability (and vice versa). If $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is a corepresentable coupling of ∞ -categories, then Theorem 8.2.0.4 guarantees the existence of a categorical pullback square

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{C}_+) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ . \end{array}$$

for some functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$, which is uniquely determined up to isomorphism; in this case, we say that the coupling λ is *corepresentable by F* (Variant 8.2.3.8). In §8.2.5, we study couplings which are simultaneously representable and corepresentable. Our main result asserts that if a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, then it is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ if and only if F is left adjoint to G (Theorem 8.2.5.1). Our proof is based on an alternative characterization of the corepresenting functor F , which we explain in §8.2.4.

Let \mathcal{C} be an ∞ -category. Then the twisted arrow coupling $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ has the following features:

- (a) The coupling λ is corepresentable. That is, for every object $X \in \mathcal{C}$, the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ has an initial object.
- (b) The coupling λ is representable. That is, for every object $Y \in \mathcal{C}$, the ∞ -category $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$ has an initial object.
- (c) Let f be an object of the ∞ -category $\text{Tw}(\mathcal{C})$, which we regard as a morphism $X \rightarrow Y$ in the ∞ -category \mathcal{C} . Then f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ if and only if it is initial when viewed as an object of the ∞ -category $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$ (by virtue of Corollary 8.1.2.21, both conditions are equivalent to the requirement that f corresponds to an isomorphism in the ∞ -category \mathcal{C}).

In §8.2.6, we show that twisted arrow couplings are characterized (up to equivalence) by these properties. More precisely, we show that a coupling $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ satisfies conditions (a), (b) and (c) if and only if it is representable (or corepresentable) by an equivalence of

∞ -categories (Theorem 8.2.6.5), and therefore equivalent to the twisted arrow ∞ -category associated to the ∞ -category \mathcal{D}_- (or \mathcal{D}_+). In this case, we say that the coupling λ is *balanced* (Definition 8.2.6.1).

8.2.1 Representable Couplings

043X We now axiomatize an essential feature of the couplings that can be obtained from Construction 8.2.0.3.

043Y **Definition 8.2.1.1.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let C be an object of \mathcal{C} , having image $\lambda(C) = (C_-, C_+) \in \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$. We say that X is *universal* if it is an initial object of the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$, and *couniversal* if it is an initial object of the ∞ -category $\{C_-\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C}$.

043Z **Remark 8.2.1.2** (Uniqueness). Let $\lambda = (\lambda_+, \lambda_-) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories, let C be a universal object of \mathcal{C} , and let D be another object of \mathcal{C} . The following conditions are equivalent:

- The object C is isomorphic to D (as an object of the ∞ -category \mathcal{C}).
- The object D is universal, and $\lambda_+(D)$ is isomorphic to $\lambda_+(C)$ (as an object of the ∞ -category \mathcal{C}_+).

0440 **Definition 8.2.1.3.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories.

- We say that λ is *representable* if, for every object $C_+ \in \mathcal{C}_+$, there exists a universal object $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$.
- We say that λ is *corepresentable* if, for every object $C_- \in \mathcal{C}_-$, there exists a couniversal object $C \in \mathcal{C}$ satisfying $\lambda_-(C) = C_-$.

0441 **Remark 8.2.1.4** (Symmetry). Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories, and let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of \mathcal{C}_+ with \mathcal{C}_- . Then the transposition $\lambda' = (\lambda_+, \lambda_-)$ can be regarded as a coupling of $\mathcal{C}_-^{\text{op}}$ with $\mathcal{C}_+^{\text{op}}$. In this situation:

- An object $C \in \mathcal{C}$ is universal for the coupling λ if and only if it is couniversal for the coupling λ' .
- The coupling λ is representable if and only if the coupling λ' is corepresentable.

0442 **Example 8.2.1.5.** Let \mathcal{C} be an ∞ -category and let $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}$ be the twisted arrow coupling of Example 8.2.0.2. For every morphism $f : X \rightarrow Y$ in the ∞ -category \mathcal{C} , Corollary 8.1.2.21 asserts that the following conditions are equivalent:

- (1) The morphism f is an isomorphism in \mathcal{C} .
- (2) As an object of $\text{Tw}(\mathcal{C})$, f is couniversal with respect to the coupling λ .
- (3) As an object of $\text{Tw}(\mathcal{C})$, f is universal with respect to the coupling λ .

In particular, the coupling λ is both representable and corepresentable.

Variant 8.2.1.6. Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories, set $\mathcal{C} = \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+$, 0443 and let $\lambda_G : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ denote the coupling of Construction 8.2.0.3. Unwinding the definitions, we see that objects of \mathcal{C} can be identified with pairs (e, C_+) , where C_+ is an object of the ∞ -category \mathcal{C}_+ and $e : C_- \rightarrow G(C_+)$ is a morphism in the ∞ -category \mathcal{C}_- . It follows from Example 8.2.1.5 that an object $(e, C_+) \in \mathcal{C}$ is universal if and only if e is an isomorphism in the ∞ -category \mathcal{C}_- . Note that every object $C_+ \in \mathcal{C}_+$ can be lifted to a universal object of \mathcal{C} (for example, we can choose e to be the identity morphism from $G(C_+)$ to itself), so that the coupling λ_G is representable. In §8.2.3, we will prove the converse: every representable coupling of ∞ -categories can be obtained (up to equivalence) from Construction 8.2.0.3(Theorem 8.2.0.4).

Our goal in this section is to establish a universal mapping property of (co)representable couplings (Proposition 8.2.1.8). First, we give a reformulation of Definition 8.2.0.1 (compare with Corollary 8.1.1.14).

Proposition 8.2.1.7. *Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. Then a morphism of simplicial sets $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is a left fibration if and only if it satisfies the following conditions:* 0444

- (1) *The morphism λ is an isofibration; in particular, \mathcal{C} is an ∞ -category.*
- (2) *The functor $\lambda_- : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}}$ is a cocartesian fibration. Moreover, a morphism u of \mathcal{C} is λ_- -cocartesian if and only if $\lambda_+(u)$ is an isomorphism in \mathcal{C}_+ .*
- (3) *The functor $\lambda_+ : \mathcal{C} \rightarrow \mathcal{C}_+$ is a cocartesian fibration. Moreover, a morphism u of \mathcal{C} is λ_+ -cocartesian if and only if $\lambda_-(u)$ is an isomorphism in $\mathcal{C}_-^{\text{op}}$.*

Proof. Suppose first that λ is a left fibration. Then λ is a cocartesian fibration, and every morphism of \mathcal{C} is λ -cocartesian (Proposition 5.1.4.14). In particular, λ is an isofibration. Let $\pi_- : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{C}_-^{\text{op}}$ and $\pi_+ : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{C}_+$ denote the projection maps. Note that π_- is a cocartesian fibration, and that a morphism (u_-, u_+) of $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is π_- -cocartesian if and only if $u_+ = \pi_+(u_-, u_+)$ is an isomorphism in the ∞ -category \mathcal{C}_+ (see Remark 5.1.4.6). Applying Proposition 5.1.4.13, we see that $\lambda_- = \pi_- \circ \lambda$ is also a cocartesian fibration, and that a morphism u of \mathcal{C} is λ_- -cocartesian if and only if $\pi_+(\lambda(u)) = \lambda_+(u)$ is an isomorphism in \mathcal{C}_+ . This proves assertion (2), and assertion (3) follows by a similar argument.

We now prove the converse. Suppose that λ satisfies conditions (1), (2), and (3); we wish to show that λ is a left fibration. We first show that λ is a cocartesian fibration. Fix an object $X \in \mathcal{C}$ having image $\overline{X} = \lambda(X)$, together with a morphism $\overline{w} : \overline{X} \rightarrow \overline{Z}$ in the product $\mathcal{C}_- \times \mathcal{C}_+$. We wish to show that we can write $\overline{u} = \lambda(w)$ for some λ -cocartesian morphism $w : X \rightarrow Z$ in \mathcal{C} . Invoking assumption (2), we can choose a λ_- -cocartesian morphism $u : X \rightarrow Y$ of \mathcal{C} satisfying $\lambda_-(u) = \pi_-(\overline{w})$. Set $\overline{Y} = \lambda(Y)$ and $\overline{u} = \lambda(u)$. Note that the morphism $\lambda_+(u) = \pi_+(\overline{u})$ is an isomorphism in the ∞ -category \mathcal{C}_+ . We can therefore choose a 2-simplex $\overline{\sigma}$ of $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ as indicated in the diagram

$$\begin{array}{ccc} & \overline{Y} & \\ \overline{u} \nearrow & \nearrow \overline{v} & \\ \overline{X} & \xrightarrow{\overline{w}} & \overline{Z}, \end{array}$$

for which the image $\pi_-(\overline{\sigma})$ is a right-degenerate 2-simplex of $\mathcal{C}_-^{\text{op}}$. Note that, if v can be lifted to a λ -cocartesian morphism $v : Y \rightarrow Z$ of \mathcal{C} , then assumption (1) guarantees that we can lift $\overline{\sigma}$ to a diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & \searrow v & \\ X & \xrightarrow{w} & Z \end{array}$$

in the ∞ -category \mathcal{C} , where w is λ -cocartesian by virtue of Proposition 5.1.4.12. Consequently, to prove the existence of w , we can replace \overline{w} by \overline{v} and thereby reduce to the case where $\lambda_-(\overline{w})$ is an isomorphism in the ∞ -category $\mathcal{C}_-^{\text{op}}$. Repeating this argument with the roles of $\mathcal{C}_-^{\text{op}}$ and \mathcal{C}_+ interchanged, we may also assume that $\lambda_+(\overline{w})$ is an isomorphism in the ∞ -category \mathcal{C}_+ . In this case, assumption (1) guarantees that we can lift \overline{w} to an isomorphism $w : X \rightarrow Z$ in the ∞ -category \mathcal{C} , which is λ -cocartesian by virtue of Proposition 5.1.1.8. This completes the proof that λ is a cocartesian fibration.

To complete the proof that λ is a left fibration, it will suffice to show that every morphism $w : X \rightarrow Z$ in \mathcal{C} is λ -cocartesian (see Proposition 5.1.4.14). Arguing as in Remark 5.1.3.8, we can choose a diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & \searrow v & \\ X & \xrightarrow{w} & Z \end{array}$$

in \mathcal{C} , where u is λ -cocartesian and $\lambda(v)$ is an isomorphism in $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$. It follows from (2) that v is λ_- -cocartesian. Since $\lambda_-(v)$ is an isomorphism in $\mathcal{C}_-^{\text{op}}$, it follows that v is an isomorphism in \mathcal{C} (Proposition 5.1.1.8). In particular, v is λ -cocartesian (Proposition 5.1.1.8), so that $w = v \circ u$ is also λ -cocartesian (Proposition 5.1.4.12). \square

Proposition 8.2.1.8. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a corepresentable coupling and let $U : \mathcal{E} \rightarrow \mathcal{C}_+$ be a cocartesian fibration of ∞ -categories. Suppose that, for every object $Y \in \mathcal{C}_+$, the fiber $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$ has an initial object. Then the ∞ -category $\text{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ has an initial object. Moreover, an object $F \in \text{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:*

- (1) *For every couniversal object $C \in \mathcal{C}$, the image $F(C)$ is initial when viewed as an object of the ∞ -category $\{\lambda_+(C)\} \times_{\mathcal{C}_+} \mathcal{E}$.*
- (2) *The functor F carries λ_+ -cocartesian morphisms of \mathcal{C} to U -cocartesian morphisms of \mathcal{E} .*

Remark 8.2.1.9. By virtue of Proposition 8.2.1.7, we can restate condition (2) of Proposition 8.2.1.8 as follows:

- (2') *Let e be a morphism of \mathcal{C} having the property that $\lambda_-(e)$ is an isomorphism in the ∞ -category $\mathcal{C}_-^{\text{op}}$. Then $F(e)$ is a U -cocartesian morphism of \mathcal{E} .*

Proof of Proposition 8.2.1.8. The functor $\lambda_- : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}}$ is a cocartesian fibration (Proposition 8.2.1.7) and is therefore exponentiable (Proposition 5.3.6.1). Let $\text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{E})$ and $\text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+)$ be the relative exponentials introduced in Construction 4.5.9.1. Composition with U induces a functor $V : \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{E}) \rightarrow \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+)$, which is an isofibration by virtue of Proposition 4.5.9.17. Let us identify the functor $\lambda_+ : \mathcal{C} \rightarrow \mathcal{C}_+$ with a section s of the projection map $\text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+) \rightarrow \mathcal{C}_-^{\text{op}}$, and form a pullback diagram

$$\begin{array}{ccc} \mathcal{D} & \longrightarrow & \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{E}) \\ \downarrow V' & & \downarrow V \\ \mathcal{C}_-^{\text{op}} & \xrightarrow{s} & \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+). \end{array}$$

Since V' is a pullback of V , it is also an isofibration (Remark 4.5.5.11). Moreover, the ∞ -category $\text{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ can be identified with the ∞ -category $\text{Fun}_{/\mathcal{C}_-^{\text{op}}}(\mathcal{C}_-^{\text{op}}, \mathcal{D})$ of sections of V' .

For each object $X \in \mathcal{C}_-$, let \mathcal{C}_X denote the fiber $\{X\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C}$. Unwinding the definitions, we can identify objects of \mathcal{D} with pairs (X, F_X) , where X is an object of \mathcal{C}_- and $F_X : \mathcal{C}_X \rightarrow \mathcal{E}$ is a functor satisfying $U \circ f = \lambda_+|_{\mathcal{C}_X}$. For fixed $X \in \mathcal{C}_-$, our assumption that λ is corepresentable

guarantees that the ∞ -category \mathcal{C}_X has an initial object C . Set $Y = \lambda_+(C)$. By assumption, the ∞ -category $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$ also has an initial object. Invoking the criterion of Corollary 7.3.6.11, we see that the ∞ -category $\{X\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{D} \simeq \text{Fun}_{/\mathcal{C}_+}(\mathcal{C}_X, \mathcal{E})$ also has an initial object. Moreover, an object $F_X \in \text{Fun}_{/\mathcal{C}_+}(\mathcal{C}_X, \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:

- (1_X) For every initial object $C \in \mathcal{C}_X$, the image $F_X(C)$ is an initial object of the ∞ -category $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$.
- (2_X) The functor F_X carries each morphism in \mathcal{C}_X to a U -cocartesian morphism of \mathcal{E} .

We will prove below that the functor V' is a cartesian fibration. Assuming this Corollary 7.3.5.7, we guarantees that the ∞ -category

$$\text{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E}) \simeq \text{Fun}_{/\mathcal{C}_-^{\text{op}}}(\mathcal{C}_-^{\text{op}}, \mathcal{D})$$

has an initial object. Moreover, an object $F \in \text{Fun}_{/\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ is initial if and only if, for every object $X \in \mathcal{C}_-$, the restriction $F_X = F|_{\mathcal{C}_X}$ satisfies conditions (1_X) and (2_X) above. Unwinding the definitions, this is equivalent to the requirement that F satisfies condition (1) and the following variant of condition (2') of Remark 8.2.1.9:

- (2'') If e is a morphism of \mathcal{C} such that $\lambda_-(e)$ is an identity morphism of $\mathcal{C}_-^{\text{op}}$, then $F(e)$ is a U -cocartesian morphism of \mathcal{E} .

The implication $(2') \Rightarrow (2'')$ is immediate. The reverse implication follows from the observation that if $\lambda_-(e)$ is an isomorphism in $\mathcal{C}_-^{\text{op}}$, then e is isomorphic (as an object of $\text{Fun}(\Delta^1, \mathcal{C})$) to a morphism e' such that $\lambda_-(e')$ is an identity morphism of $\mathcal{C}_-^{\text{op}}$.

We now complete the proof by showing that V' is a cartesian fibration. Fix an object $(X, F_X) \in \mathcal{D}$, and a morphism $u : X' \rightarrow X$ in the ∞ -category $\mathcal{C}_-^{\text{op}}$. We wish to show that u can be lifted to a V' -cartesian morphism $\tilde{u} : (X', F_{X'}) \rightarrow (X, F_X)$ in the ∞ -category \mathcal{D} . We will prove a slightly stronger assertion: we can arrange that the image of \tilde{u} in the ∞ -category $\text{Fun}(\mathcal{C}/\mathcal{C}_-^{\text{op}}, \mathcal{E})$ is V -cartesian. Let us identify u with a morphism $\Delta^1 \rightarrow \mathcal{C}_-^{\text{op}}$ and set $\mathcal{C}_u = \Delta^1 \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C}$, so that \mathcal{C}_X can be identified with the fiber $\{1\} \times_{\Delta^1} \mathcal{C}_u$. By virtue of Corollary 7.3.7.6, it will suffice to show that the lifting problem

$$\begin{array}{ccc} \mathcal{C}_X & \xrightarrow{F_X} & \mathcal{E} \\ & \swarrow F_u & \downarrow U \\ \mathcal{C}_u & \xrightarrow{\quad} & \mathcal{C}_+ \end{array}$$

admits a solution having the property that F_u is U -right Kan extended from \mathcal{C}_X .

Let $\pi : \mathcal{C}_u \rightarrow \Delta^1$ denote the projection map. Since π is a pullback of λ_- , it is a cocartesian fibration of ∞ -categories (Proposition 8.2.1.7). In particular, \mathcal{C}_X is a reflective subcategory of \mathcal{C}_u . Moreover, if C is an object of \mathcal{C}_X , then a morphism $v : C' \rightarrow C$ in \mathcal{C}_u is π -cocartesian if and only if it exhibits C as a \mathcal{C}_X -reflection of C' (see Proposition 6.2.2.17). By virtue of Corollary 7.3.5.9, it will suffice to show that if this condition is satisfied, then $\lambda_+(v)$ can be lifted to a U -cartesian morphism $E \rightarrow F_X(C)$ in \mathcal{E} . This is clear: our assumption that v is π -cocartesian guarantees that $\lambda_+(v)$ is an isomorphism in the ∞ -category \mathcal{C}_+ (Proposition 8.2.1.7), and can therefore be lifted to an isomorphism in \mathcal{E} by virtue of the fact that U is an isofibration (Proposition 5.1.4.8). \square

Corollary 8.2.1.10. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Suppose 0447 that, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \mathcal{E} \times_{\mathcal{C}} \{C\}$ has an initial object. Then the ∞ -category $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}), \mathcal{E})$ has an initial object. Moreover, an object $F \in \text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}), \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:*

- (1) *For every object $C \in \mathcal{C}$, the image $F(\text{id}_C)$ is an initial object of the ∞ -category \mathcal{E}_C .*
- (2) *Let e be a morphism of $\text{Tw}(\mathcal{C})$ whose image in \mathcal{C}^{op} is an isomorphism. Then $F(e)$ is a U -cocartesian morphism of \mathcal{E} .*

Stated more informally, Corollary 8.2.1.10 asserts that the twisted arrow ∞ -category $\text{Tw}(\mathcal{C})$ is *universal* among ∞ -categories \mathcal{E} equipped with a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ having the property that each fiber of U has an initial object.

8.2.2 Morphisms of Couplings

We begin by introducing a companion of Definition 8.2.0.1. 0448

Definition 8.2.2.1. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. A *morphism of couplings* from λ to μ is a triple of functors

$$F_- : \mathcal{C}_- \rightarrow \mathcal{D}_- \quad F : \mathcal{C} \rightarrow \mathcal{D} \quad F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$$

for which the diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

is commutative. Note that such diagrams can be identified with the vertices of a simplicial set $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$, defined by the formula

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) = \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})} \text{Fun}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

044A **Proposition 8.2.2.2.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Then the projection maps*

$$\Phi_- : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \quad \Phi_+ : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

induce a left fibration

$$(\Phi_-, \Phi_+) : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

Proof. By construction, there is a pullback diagram of simplicial sets

$$\begin{array}{ccc} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) & \longrightarrow & \text{Fun}(\mathcal{C}, \mathcal{D}) \\ \downarrow (\Phi_-, \Phi_+) & & \downarrow \mu \circ \\ \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{\circ \lambda} & \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+). \end{array}$$

It will therefore suffice to show that the right vertical map is a left fibration (Remark 4.2.1.8), which follows from our assumption that μ is a left fibration (Corollary 4.2.5.2). \square

044B **Remark 8.2.2.3** (Functor Couplings). Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Proposition 8.2.2.2 asserts that the induced map

$$\Phi = (\Phi_-, \Phi_+) : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

is also a coupling of ∞ -categories. Moreover, it is characterized by a universal property: for every coupling of ∞ -categories $\kappa : \mathcal{B} \rightarrow \mathcal{B}_-^{\text{op}} \times \mathcal{B}_+$, there is a canonical isomorphism of simplicial sets

$$\text{Fun}_{\pm}(\mathcal{B}, \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})) \simeq \text{Fun}_{\pm}(\mathcal{B} \times \mathcal{C}, \mathcal{D}),$$

where the right hand side is defined using the product coupling

$$\mathcal{B} \times \mathcal{C} \xrightarrow{\kappa \times \lambda} (\mathcal{B}_- \times \mathcal{C}_-)^{\text{op}} \times (\mathcal{B}_+ \times \mathcal{C}_+).$$

044C **Remark 8.2.2.4.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories, and suppose we are given a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+. \end{array}$$

It follows from Proposition 8.2.1.7 that the functor F carries λ_- -cocartesian morphisms of \mathcal{C} to μ_- -cocartesian morphisms of \mathcal{D} , and λ_+ -cocartesian morphisms of \mathcal{C} to μ_+ -cocartesian morphisms of \mathcal{D} .

Corollary 8.2.2.5. *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Then the simplicial set $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is an ∞ -category.*

Proof. Combine Proposition 8.2.2.2 with Remark 4.2.1.4. \square

Example 8.2.2.6. The canonical isomorphism $\lambda : \Delta^0 \xrightarrow{\sim} (\Delta^0)^{\text{op}} \times \Delta^0$ can be regarded as a coupling of the 0-simplex Δ^0 with itself. For every coupling of ∞ -categories $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$, the ∞ -category $\text{Fun}_{\pm}(\Delta^0, \mathcal{D})$ can be identified with the ∞ -category \mathcal{D} .

Exercise 8.2.2.7. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories, and suppose we are given a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array} \quad \begin{matrix} 04\text{AT} \\ (8.23) \end{matrix}$$

Show that the following conditions are equivalent:

- The functors F_- , F , and F_+ are equivalences of ∞ -categories.
- There exists a morphism of couplings $(G_-, G, G_+) \in \text{Fun}_{\pm}(\mathcal{D}, \mathcal{C})$ which is a homotopy inverse to (F_-, F, F_+) , in the sense that the compositions $(G_- \circ F_-, G \circ F, G_+ \circ F_+)$ and $(F_- \circ G_-, F \circ G, F_+ \circ G_+)$ are isomorphic to $(\text{id}_{\mathcal{C}_-}, \text{id}_{\mathcal{C}}, \text{id}_{\mathcal{C}_+})$ and $(\text{id}_{\mathcal{D}_-}, \text{id}_{\mathcal{D}}, \text{id}_{\mathcal{D}_+})$ as objects of the ∞ -categories $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$ and $\text{Fun}_{\pm}(\mathcal{D}, \mathcal{D})$, respectively.

If these conditions are satisfied, we will say that the diagram (8.23) is an *equivalence of couplings*.

Remark 8.2.2.8. Suppose we are given a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

which is an equivalence (in the sense of Exercise 8.2.2.7). Then:

- The coupling λ is representable if and only if the coupling μ is representable.
- The coupling λ is corepresentable if and only if the coupling μ is corepresentable.
- An object $C \in \mathcal{C}$ is universal (with respect to the coupling λ) if and only if $F(C)$ is universal \mathcal{D} (with respect to the coupling μ).
- An object $C \in \mathcal{C}$ is universal (with respect to the coupling λ) if and only if $F(C)$ is universal \mathcal{D} (with respect to the coupling μ).

See Corollaries 4.6.6.21 and 4.6.6.20.

Beware that, in the situation of Definition 8.2.2.1, the ∞ -category $\text{Fun}_\pm(\mathcal{C}, \mathcal{D})$ depends not only on \mathcal{C} and \mathcal{D} , but also on the left fibrations $\lambda : \mathcal{C} \rightarrow \mathcal{C}_- \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_- \times \mathcal{D}_+$. Our goal in this section is to show that, nevertheless, it can often be identified with a full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D})$ (Proposition 8.2.2.9).

044F Proposition 8.2.2.9. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Let $\mathcal{E}_- \subseteq \text{Fun}(\mathcal{C}, \mathcal{D})$ be the full subcategory spanned by those functors $F : \mathcal{C} \rightarrow \mathcal{D}$ which carry λ_+ -cocartesian morphisms of \mathcal{C} to μ_+ -cocartesian morphisms of \mathcal{D} , define $\mathcal{E}_+ \subseteq \text{Fun}(\mathcal{C}, \mathcal{D})$ similarly, and set $\mathcal{E}_\pm = \mathcal{E}_- \cap \mathcal{E}_+$. Then:*

- (1) *Suppose that, for every object $C_- \in \mathcal{C}_-$, the ∞ -category $\{C_-\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C}$ is weakly contractible. Then the forgetful functor*

$$\text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{E}_- \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

is an equivalence of ∞ -categories.

- (2) *Suppose that, for every object $C_+ \in \mathcal{C}_+$, the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$ is weakly contractible. Then the forgetful functor*

$$\text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})} \mathcal{E}_+$$

is an equivalence of ∞ -categories.

- (3) *If the hypotheses of both (1) and (2) are satisfied, then the forgetful functor $\text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{E}_\pm$ is an equivalence of ∞ -categories.*

Proof. We first prove (1). Let W be the collection of all λ_+ -cocartesian morphisms of \mathcal{C} . Note that a morphism u of \mathcal{C} belongs to W if and only if $\lambda_-(u)$ is an isomorphism in the ∞ -category $\mathcal{C}_-^{\text{op}}$ (Proposition 8.2.1.7). Suppose that, for every object $C_- \in \mathcal{C}_-$, the ∞ -category $\{C_-\} \times_{\mathcal{C}_-} \mathcal{C}$ is weakly contractible. Applying Corollary 6.3.5.3, we deduce that the functor λ_- exhibits $\mathcal{C}_-^{\text{op}}$ as a localization of \mathcal{C} with respect to W . It follows that precomposition

with λ_- induces an equivalence of ∞ -categories $\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\text{op}})$, where $\text{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\text{op}})$ denotes the full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})$ spanned by those functors which carry each element of W to an isomorphism in $\mathcal{D}_-^{\text{op}}$ (Notation 6.3.1.1). We have a commutative diagram of ∞ -categories

$$\begin{array}{ccc}
\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) & \longrightarrow & \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} & 044G \\
\downarrow & & \downarrow \circ \lambda_- & \\
\mathcal{E}_- \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \longrightarrow & \text{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\text{op}}) & (8.24) \\
\downarrow & & \downarrow & \\
\text{Fun}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{\theta} & \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) &
\end{array}$$

in which both squares are pullbacks. To prove (1), it will suffice to show that the upper square is a categorical pullback diagram (Proposition 4.5.2.20). In fact, we will show that θ is an isofibration, so that both squares are categorical pullback diagrams (Corollary 4.5.2.22). This follows by observing that θ factors as a composition

$$\text{Fun}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \xrightarrow{\theta'} \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \xrightarrow{\theta''} \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}),$$

where θ' is a pullback of the composition map $\text{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu \circ} \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+)$ (hence a left fibration by virtue of Corollary 4.2.5.2) and θ'' is a pullback of the projection map $\text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \rightarrow \Delta^0$. This completes the proof of assertion (1).

Assertion (2) follows by a similar argument. We now prove (3). Suppose that λ satisfies the hypotheses of both (1) and (2); we wish to prove that the forgetful functor $T : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{E}_{\pm}$ is an equivalence of ∞ -categories. Note that T factors as a composition

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \xrightarrow{T'} \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})} \mathcal{E}_+ \xrightarrow{T''} \mathcal{E}_{\pm},$$

where T' is an equivalence of ∞ -categories by virtue of (2). It will therefore suffice to show

that T'' is an equivalence of ∞ -categories. We have a commutative diagram

$$\begin{array}{ccc}
 \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}})} \mathcal{E}_+ & \longrightarrow & \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \\
 \downarrow T'' & & \downarrow \circ \lambda_- \\
 \mathcal{E}_{\pm} & \xrightarrow{\mu_- \circ} & \mathrm{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\mathrm{op}}) \\
 \downarrow & & \downarrow \\
 \mathcal{E}_+ & \xrightarrow{\rho} & \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}}),
 \end{array}$$

where both squares are pullbacks and the upper right vertical map is an equivalence of ∞ -categories. It will therefore suffice to show that the upper square is a categorical pullback diagram (Proposition 4.5.2.20). In fact, we claim that ρ is an isofibration, so that both squares are categorical pullback diagrams (Corollary 4.5.2.22). This follows by observing that ρ is the restriction of the map $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu_- \circ} \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}})$ (which is a cocartesian fibration by virtue of Proposition 8.2.1.7 and Theorem 5.2.1.1) to a replete subcategory $\mathcal{E}_+ \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$. \square

044H Corollary 8.2.2.10. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Fix a functor $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$. If λ is corepresentable, then the forgetful functor*

$$\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \rightarrow \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D})$$

is fully faithful, and its essential image is the full subcategory $\mathrm{Fun}_{/\mathcal{D}_+}^0(\mathcal{C}, \mathcal{D}) \subseteq \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D})$ spanned by those functors which carry λ_+ -cocartesian morphisms of \mathcal{C} to μ_+ -cocartesian morphisms of \mathcal{D} .

Proof. Let $\mathcal{E}_- \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ be the full subcategory defined in Proposition 8.2.2.9. We then

have a commutative diagram of ∞ -categories

$$\begin{array}{ccc}
 \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} & \longrightarrow & \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \\
 \downarrow & & \downarrow \\
 \mathrm{Fun}_{/\mathcal{D}_+}^0(\mathcal{C}, \mathcal{D}) & \longrightarrow & \mathcal{E}_- \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)} \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \\
 \downarrow & & \downarrow \\
 \{F_+\} & \longrightarrow & \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+),
 \end{array} \tag{8.25}$$

where both squares are pullback diagrams. Note that the vertical map on the lower right is a pullback of the functor $\mathcal{E}_- \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)$ obtained by restricting the cocartesian fibration $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu+} \mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)$ (see Proposition 8.2.1.7 and Theorem 5.2.1.1) to the replete subcategory $\mathcal{E}_- \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$, and is therefore an isofibration. Moreover, the right vertical composition $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$ is a cocartesian fibration (see Proposition 8.2.1.7 and Remark 8.2.2.3), and therefore an isofibration. It follows that the bottom square and outer rectangle of (8.25) are categorical pullback diagrams (Corollary 4.5.2.22), so that the upper square is also a categorical pullback diagram (Proposition 4.5.2.17). Our assumption that λ is corepresentable guarantees that for each object $X_- \in \mathcal{C}_-$, the fiber $\{X_-\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$ has an initial object, and is therefore weakly contractible. Applying Proposition 8.2.2.9, we deduce that the vertical map on the upper right is an equivalence of ∞ -categories. Invoking Proposition 4.5.2.20, we conclude that the forgetful functor $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \rightarrow \mathrm{Fun}_{/\mathcal{D}_+}^0(\mathcal{C}, \mathcal{D})$ is also an equivalence of ∞ -categories. \square

We can now formulate the main result of this section.

Theorem 8.2.2.11. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a representable coupling of ∞ -categories and let $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be a corepresentable coupling of ∞ -categories. Then the functor coupling*

$$\Phi = (\Phi_-, \Phi_+) : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

is corepresentable. Moreover, an object $(F_-, F, F_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is couniversal if and only if the functor $F : \mathcal{C} \rightarrow \mathcal{D}$ carries universal objects of \mathcal{C} to couniversal objects of \mathcal{D} .

Proof. Fix a functor $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$; we wish to show that it can be extended to a couniversal object $(F_-, F, F_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. Set $\mathcal{E} = \mathcal{C}_-^{\mathrm{op}} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$. Then projection onto the first factor determines a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}_-^{\mathrm{op}}$ (Proposition 8.2.1.7). Let $\mathrm{Fun}_{/\mathcal{C}_-^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$

denote the full subcategory of $\text{Fun}_{/\mathcal{C}^{\text{op}}}(\mathcal{C}, \mathcal{E})$ spanned by those functors which carry λ_- -cocartesian morphisms of \mathcal{C} to U -cocartesian of \mathcal{E} (Notation 5.3.1.10). Corollary 8.2.2.10 guarantees that the forgetful functor

$$\{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}_{/\mathcal{C}_-^{\text{op}}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories. Theorem 8.2.2.11 can therefore be restated as follows:

- (1) The ∞ -category $\text{Fun}_{/\mathcal{C}_-^{\text{op}}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ has an initial object.
- (2) An object $F \in \text{Fun}_{/\mathcal{C}_-^{\text{op}}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ is initial if and only if, for universal object $C \in \mathcal{C}$, the image $F(C)$ is an initial object of the ∞ -category

$$\mathcal{E}_{\lambda_-(C)} \simeq \{F_-(\lambda_-(C))\} \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}.$$

Our assumption that μ is corepresentable guarantees that, for each object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_{\lambda_-(C)}$ has an initial object. Consequently, assertions (1) and (2) follow from (the dual of) Proposition 8.2.1.8. \square

044L **Example 8.2.2.12.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then the commutative diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\text{Tw}(F)} & \text{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{F^{\text{op}} \times F} & \mathcal{D}^{\text{op}} \times \mathcal{D} \end{array} \tag{8.26}$$

is a morphism of couplings. It follows from Theorem 8.2.2.11 that this morphism is initial when viewed as an object of the ∞ -category $\{F\} \times_{\text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$.

044N **Corollary 8.2.2.13.** Let \mathcal{C} and \mathcal{D} be ∞ -categories, and suppose we are given a pair of functors $F_-, F_+ : \mathcal{C} \rightarrow \mathcal{D}$. Then F_- and F_+ are isomorphic (as objects of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$) if and only if there exists a morphism of couplings

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}^{\text{op}} \times \mathcal{D} \end{array} \tag{8.27}$$

having the property that the functor \tilde{F} carries isomorphisms of \mathcal{C} (regarded as objects of $\text{Tw}(\mathcal{C})$) to isomorphisms of \mathcal{D} (regarded as objects of $\text{Tw}(\mathcal{D})$).

Proof. Suppose first that there exists an isomorphism of functors $\alpha : F_- \rightarrow F_+$. Since the projection map $\text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\text{op}} \times \mathcal{D}$ is an isofibration, we can use Corollary 4.4.5.6 to lift the natural transformation

$$(\text{id} \times \alpha) : F_-^{\text{op}} \times F_+ \rightarrow F_-^{\text{op}} \times F_-$$

to an isomorphism $\tilde{F} \rightarrow \text{Tw}(F_-)$ in the ∞ -category $\text{Fun}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$, so that we have a commutative diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}^{\text{op}} \times \mathcal{D} \end{array}$$

where \tilde{F} carries isomorphisms of \mathcal{C} to isomorphisms of \mathcal{D} .

We now prove the converse. Suppose we are given a commutative diagram (8.27), where \tilde{F} carries isomorphisms of \mathcal{C} to isomorphisms of \mathcal{D} . Applying Theorem 8.2.2.11, we deduce that the triple (F_-, \tilde{F}, F_+) is initial when viewed as an object of the ∞ -category $\{F_-\} \times_{\text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$. Applying Example 8.2.2.12 (and Corollary 4.6.6.15), we deduce that (F_-, \tilde{F}, F_+) is isomorphic to $(F_-, \text{Tw}(F_-), F_-)$ as an object of the ∞ -category $\{F_-\} \times_{\text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$. In particular, F_+ is isomorphic to F_- as an object of $\text{Fun}(\mathcal{C}, \mathcal{D})$. \square

8.2.3 Representations of Couplings

We now apply Theorem 8.2.2.11 to give a classification of representable couplings. 044Q

Definition 8.2.3.1. Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories. We will say that a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is *representable by G* if it is equivalent (as a left fibration over $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$) to the coupling λ_G of Construction 8.2.0.3. 044R

Remark 8.2.3.2. Let $G, G' : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be functors which are isomorphic (as objects of the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$). Then a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is representable by G if and only if it is representable by G' . See Proposition 5.1.7.5. 044S

Example 8.2.3.3. Let \mathcal{C} be an ∞ -category. Then the twisted arrow coupling $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Example 8.2.0.2 is representable by the identity functor $\text{id} : \mathcal{C} \rightarrow \mathcal{C}$. 044T

Our goal is to prove the following restatement of Theorem 8.2.0.4:

Theorem 8.2.3.4. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. Then λ is representable (in the sense of Definition 8.2.1.3) if and only there exists a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ such that λ is representable by G (in the sense of Definition 8.2.3.1). If this condition is satisfied, then the functor G is uniquely determined up to isomorphism. 044U

Before giving the proof of Theorem 8.2.3.4, it will be useful to formulate a more precise version of Definition 8.2.3.1.

044V **Definition 8.2.3.5.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor. We say that a morphism of couplings

$$\begin{array}{ccc} 044W & \mathcal{C} & \xrightarrow{\tilde{G}} \text{Tw}(\mathcal{C}_-) \\ & \downarrow \lambda & \downarrow \\ & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad (8.28)$$

exhibits the coupling λ as represented by G if it is a categorical pullback square. Note that λ is representable by G if and only if there exists a morphism of couplings which exhibits λ as represented by G .

We now describe an alternative formulation of Definition 8.2.3.5.

044X **Lemma 8.2.3.6.** Suppose we are given a morphism of couplings

$$\begin{array}{ccc} 044Y & \mathcal{C} & \xrightarrow{F} \mathcal{D} \\ & \downarrow \lambda & \downarrow \mu \\ & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+, \end{array} \quad (8.29)$$

where λ is representable and F_- is an equivalence of ∞ -categories. The following conditions are equivalent:

- (1) The diagram (8.29) is a categorical pullback square.
- (2) For every object $Y \in \mathcal{C}_+$, the functor F induces an equivalence of ∞ -categories

$$F_Y : \mathcal{C} \times_{\mathcal{C}_+} \{Y\} \rightarrow \mathcal{D} \times_{\mathcal{D}_+} \{F_+(Y)\}.$$

- (3) For every universal object $C \in \mathcal{C}$, the image $F(C) \in \mathcal{D}$ is universal.

Proof. The equivalence (1) \Leftrightarrow (2) follows from Theorem 5.1.6.1 and Remark 8.2.2.4. To complete the proof, it will suffice to show that for each object $Y \in \mathcal{C}_+$, the following conditions are equivalent:

- (2_Y) The functor F_Y is an equivalence of ∞ -categories.

(3_Y) The functor F_Y carries initial objects of $\mathcal{C} \times_{\mathcal{C}_+} \{Y\}$ to initial objects of $\mathcal{D} \times_{\mathcal{D}_+} \{F_+(Y)\}$.

Replacing \mathcal{D} by the ∞ -category $\mathcal{C}_-^{\text{op}} \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$, we can assume that F_- is an isomorphism. In this case, the equivalence of (2_Y) and (3_Y) is a special case of Corollary 4.6.6.21. \square

Proposition 8.2.3.7. *Suppose we are given a morphism of couplings*

044Z

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad \begin{matrix} 0450 \\ (8.30) \end{matrix}$$

The following conditions are equivalent:

- (1) The diagram (8.30) exhibits the coupling λ as represented by the functor G (in the sense of Definition 8.2.3.1).
- (2) For every object $C \in \mathcal{C}_+$, the functor \tilde{G} induces an equivalence of ∞ -categories

$$\tilde{G}_C : \mathcal{C} \times_{\mathcal{C}_+} \{C\} \rightarrow \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \{G(C)\}.$$

- (3) The coupling λ is representable and, for every universal object $C \in \mathcal{C}$, the image $\tilde{G}(C) \in \text{Tw}(\mathcal{C}_-)$ is an isomorphism (when viewed as a morphism of the ∞ -category \mathcal{C}_-).
- (4) The coupling λ is representable and the triple $(\text{id}, \tilde{G}, G)$ is initial when viewed as an object of the ∞ -category $\{\text{id}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{C}_-))$.

Proof. The implication (1) \Rightarrow (2) is immediate. Note that, if condition (2) is satisfied, then the coupling λ is representable; the implications (2) \Rightarrow (3) \Rightarrow (1) then follow from Lemma 8.2.3.6 (using the characterization of universal objects of $\text{Tw}(\mathcal{C}_-)$ given by Example 8.2.1.5). The equivalence (3) \Leftrightarrow (4) follows from Theorem 8.2.2.11. \square

Proof of Theorem 8.2.3.4. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. It follows from Proposition 8.2.3.7 that λ is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ if and only if it is representable and G can be lifted to an initial object of the ∞ -category $\mathcal{E} = \{\text{id}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{C}_-))$. This immediately shows that G is uniquely determined up to isomorphism. To prove existence, it suffices to show that if λ is representable then \mathcal{E} has an initial object. This follows from Theorem 8.2.2.11. \square

- 0451 **Variant 8.2.3.8.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ be a functor. We say that λ is *corepresentable by* F if there exists a categorical pullback square

0452

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{C}_+) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+. \end{array} \quad (8.31)$$

In this case, we will say that the diagram (8.31) *exhibits the coupling λ as corepresented by F* . It follows from Theorem 8.2.3.4 that λ is corepresentable (in the sense of Definition 8.2.1.3) if and only if it is corepresentable by F , for some functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$. Moreover, if this condition is satisfied, then the functor F is uniquely determined up to isomorphism.

Couplings representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ can be characterized by a universal mapping property.

- 0453 **Proposition 8.2.3.9.** Let $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be a coupling of ∞ -categories, let $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$ be a functor, and suppose we are given a morphism of couplings

0454

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{D}_-) \\ \downarrow & & \downarrow \\ \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ & \xrightarrow{\text{id} \times G} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_-. \end{array} \quad (8.32)$$

The following conditions are equivalent:

- (1) The diagram (8.32) exhibits μ as represented by G (in the sense of Definition 8.2.3.5).
- (2) For every coupling of ∞ -categories $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and every pair of functors $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$, composition with \tilde{G} induces a homotopy equivalence of Kan complexes

$$\begin{array}{c} \{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \\ \downarrow \\ \{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\} \end{array}$$

- (3) For every coupling of ∞ -categories $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and every functor $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$, composition \tilde{G} induces an equivalence of ∞ -categories

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \rightarrow \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\}.$$

Proof. We first show that (1) \Rightarrow (2). Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$ be functors. If condition (1) is satisfied, then Remark 4.5.2.8 guarantees that the diagram

$$\begin{array}{ccc} \text{Fun}(\mathcal{C}, \mathcal{D}) & \xrightarrow{\tilde{G}\circ} & \text{Fun}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \\ \downarrow \mu\circ & & \downarrow \\ \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}, \mathcal{D}_+) & \longrightarrow & \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}, \mathcal{D}_-) \end{array}$$

is a categorical pullback square, where the vertical maps are left fibrations (Corollary 4.2.5.2). Assertion (2) now follows by applying Corollary 4.5.2.26 to the object $(F_-^{\text{op}} \circ \lambda_-, F_+ \circ \lambda_+) \in \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}, \mathcal{D}_+)$. The implication (2) \Rightarrow (3) follows by applying Corollary 5.1.6.4 to the commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} & \longrightarrow & \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\} \\ & \searrow & \swarrow \\ & \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}, & \end{array}$$

since the vertical maps are left fibrations (Proposition 8.2.2.2). We complete the proof by showing that (3) implies (1). Specializing assertion (3) to the coupling $\lambda : \Delta^0 \xrightarrow{\sim} (\Delta^0)^{\text{op}} \times \Delta^0$, we deduce that \tilde{G} induces an equivalence of ∞ -categories $\mathcal{D} \times_{\mathcal{D}_+} \{D\} \rightarrow \text{Tw}(\mathcal{D}_-) \times_{\mathcal{D}_-} \{G(D)\}$ for each object $D \in \mathcal{D}_+$, so that (8.32) is a categorical pullback square by virtue of Proposition 8.2.3.7. \square

8.2.4 Presentations of Representable Couplings

For some applications, it is convenient to work with a variant of Definition 8.2.3.5.

0455

0456 **Definition 8.2.4.1.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor. We will say that a morphism of couplings

$$\begin{array}{ccc} 0457 & \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} \mathcal{C} \\ & \downarrow & \downarrow \lambda \\ & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array} \quad (8.33)$$

exhibits λ as represented by G if, for every object $C \in \mathcal{C}_+$, the image $\tilde{G}(\text{id}_C)$ is a universal object of \mathcal{C} .

0458 **Remark 8.2.4.2.** In the situation of Definition 8.2.4.1, if the diagram (8.33) exhibits λ as represented by G if and only if the functor \tilde{G} carries each isomorphism in \mathcal{C}_+ (regarded as an object of the ∞ -category $\text{Tw}(\mathcal{C}_+)$) to a universal object of \mathcal{C} . This follows from Remark 8.2.1.2, since every isomorphism in \mathcal{C}_+ is isomorphic to an identity morphism (when viewed as an object of $\text{Tw}(\mathcal{C}_+)$).

0459 **Proposition 8.2.4.3.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor. The following conditions are equivalent:

- (1) *The coupling λ is representable by G (in the sense of Definition 8.2.3.1).*
- (2) *There exists a morphism of couplings*

$$\begin{array}{ccc} & \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} \mathcal{C} \\ & \downarrow & \downarrow \lambda \\ & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array}$$

which exhibits λ as represented by G (in the sense of Definition 8.2.4.1).

Proof. We first show that (2) implies (1). Suppose that there exists a morphism of couplings

$$\begin{array}{ccc} 045A & \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} \mathcal{C} \\ & \downarrow & \downarrow \lambda \\ & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array} \quad (8.34)$$

which exhibits λ as represented by G (in the sense of Definition 8.2.4.1). For each object $C_+ \in \mathcal{C}_+$, the functor \tilde{G} carries $\text{id}_{\mathcal{C}}$ to a universal object of $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$. It follows that the coupling λ is representable. Theorem 8.2.3.4, guarantees that there exists a functor $G' : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ such that λ is representable by G' . Choose morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}'} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G'} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad \begin{array}{r} 045B \\ (8.35) \end{array}$$

which exhibits λ as represented by G' (in the sense of Definition 8.2.3.5). Composing (8.35) with (8.34), we obtain a morphism of twisted arrow couplings

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}' \circ \tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times G'} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \end{array}$$

where the functor $\tilde{G}' \circ \tilde{G}$ carries isomorphisms of \mathcal{C}_+ to isomorphisms of \mathcal{C}_- . Invoking Corollary 8.2.2.13, we deduce that the functors G and G' are isomorphic, so that λ is also representable by G (Remark 8.2.3.2).

We now show that (1) implies (2). Assume that λ is representable by G . Setting $G' = G$, we can choose a diagram (8.35) which exhibits λ as represented by G . Applying Proposition 8.2.3.9, we deduce that composition with \tilde{G}' induces a homotopy equivalence of Kan complexes

$$\begin{array}{c} \{G\} \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \mathcal{C}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_+)} \{\text{id}\} \\ \downarrow \theta \\ \{G\} \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)} \{G\}. \end{array}$$

In particular, there exists an object $(G, \tilde{G}, \text{id}) \in \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \mathcal{C})$ such that $(\text{id}, \tilde{G}', G) \circ (G, \tilde{G}, \text{id})$ is isomorphic to $(G, \text{Tw}(G), G)$ in the ∞ -category $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-))$. In particular, the functor $\tilde{G}' \circ \tilde{G} : \text{Tw}(\mathcal{C}_+) \rightarrow \text{Tw}(\mathcal{C}_-)$ is isomorphic to the functor $\text{Tw}(G)$, and therefore carries isomorphisms of \mathcal{C}_+ to isomorphisms of \mathcal{C}_- . It follows that the functor

$\tilde{G} : \text{Tw}(\mathcal{C}_+) \rightarrow \mathcal{C}$ carries isomorphisms in \mathcal{C}_+ to universal objects of \mathcal{C} , so that the diagram (8.34) exhibits λ as represented by G . \square

045C **Corollary 8.2.4.4.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories which are representable by functors $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ and $H : \mathcal{D}_+ \rightarrow \mathcal{D}_-$, respectively. Let $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$ be functors. The following conditions are equivalent:*

- (1) *The functors $H \circ F_+$ and $F_- \circ G$ are isomorphic (as objects of the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)$. That is, the diagram of ∞ -categories*

$$\begin{array}{ccc} \mathcal{C}_+ & \xrightarrow{F_+} & \mathcal{D}_+ \\ \downarrow G & & \downarrow H \\ \mathcal{C}_- & \xrightarrow{F_-} & \mathcal{D}_- \end{array}$$

commutes up to isomorphism.

- (2) *There is a morphism of couplings*

045D

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+, \end{array} \quad (8.36)$$

where the functor \tilde{F} carries universal objects of \mathcal{C} to universal objects of \mathcal{D} .

Proof. Choose morphisms of couplings

045E

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\ \downarrow & & \downarrow \lambda \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array} \quad \begin{array}{ccc} \mathcal{D} & \xrightarrow{\tilde{H}} & \text{Tw}(\mathcal{D}_-) \\ \downarrow \mu & & \downarrow \\ \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ & \xrightarrow{\text{id} \times H} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_-, \end{array} \quad (8.37)$$

which exhibit λ and μ as represented by G and H , respectively. We first prove that (2) implies (1). Suppose there exists a diagram (8.36), where \tilde{F} carries universal objects of \mathcal{C} to

universal objects of \mathcal{D} . Composing with the morphisms (8.37), we obtain a morphism of twisted arrow couplings

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{H} \circ \tilde{F} \circ \tilde{G}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{(F_- \circ G)^{\mathrm{op}} \times (H \circ F_+)} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-, \end{array}$$

where the functor $\tilde{H} \circ \tilde{F} \circ \tilde{G}$ carries isomorphisms in \mathcal{C}_+ to isomorphisms in \mathcal{D}_- . Applying Corollary 8.2.2.13, we deduce that the functors $F_- \circ G$ and $H \circ F_+$ are isomorphic.

We now show that (1) implies (2). Since λ is representable and the twisted arrow pairing $\mathrm{Tw}(\mathcal{D}_-) \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-$ is corepresentable, Theorem 8.2.2.11 guarantees that there exists a morphism of pairings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{T}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\mathrm{op}} \times T_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-, \end{array} \tag{8.38}$$
045F

where \tilde{T} carries universal objects of \mathcal{C} to isomorphisms in the ∞ -category \mathcal{D}_- . Composing with the pairing on the left half of (8.37), we obtain a morphism of twisted arrow pairings

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{T} \circ \tilde{G}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{(F_- \circ G)^{\mathrm{op}} \times T_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-. \end{array}$$

Applying Corollary 8.2.2.13, we conclude that T_+ is isomorphic to the functor $F_- \circ G$. If condition (1) is satisfied, then T_+ is also isomorphic to the functor $H \circ F_+$. Replacing (8.38) by an isomorphic objects of ∞ -category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}} \times \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-))$, we may assume without loss of generality that T_+ is equal to $H \circ F_+$. Invoking the universal property

of Proposition 8.2.3.9, we can further assume that (8.38) factors as a composition

$$\begin{array}{ccccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \mathcal{D} & \xrightarrow{\tilde{H}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow \lambda & & \downarrow \mu & & \downarrow \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\mathrm{op}} \times F_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ & \xrightarrow{\mathrm{id} \times H} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-. \end{array}$$

Since $\tilde{T} = \tilde{H} \circ \tilde{F}$ carries universal objects of \mathcal{D} to isomorphisms in \mathcal{D}_- , the functor \tilde{F} carries universal objects of \mathcal{C} to universal objects of \mathcal{D} . \square

045G **Variant 8.2.4.5.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ be a functor. We will say that a morphism of couplings

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_-) & \xrightarrow{\tilde{F}} & \mathcal{C} \\ \downarrow & & \downarrow \lambda \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- & \xrightarrow{\mathrm{id} \times F} & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \end{array} \quad (8.39)$$

exhibits λ as corepresented by F if, for every object $X_- \in \mathcal{C}_-$, the image $\tilde{F}(\mathrm{id}_{X_-})$ is a couniversal object of \mathcal{C} . Equivalently, the diagram (8.39) exhibits λ as corepresented by F if exhibits the coupling $\lambda' : \mathcal{C} \rightarrow \mathcal{C}_+ \times \mathcal{C}_-^{\mathrm{op}}$ of Remark 8.2.1.4 as represented by the functor $F^{\mathrm{op}} : \mathcal{C}_-^{\mathrm{op}} \rightarrow \mathcal{C}_+^{\mathrm{op}}$.

We now apply these ideas to prove a more precise version of Theorem 8.2.2.11. To (slightly) simplify the notation, we state the result in a dual form.

045J **Theorem 8.2.4.6.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Assume that λ is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ and that μ is representable by a functor $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$. Then:

(1) *The coupling*

$$\Phi : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

of Remark 8.2.2.3 is representable by the functor

$$\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-) \quad T_+ \mapsto G \circ T_+ \circ F.$$

(2) *An object $(T_-, T, T_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is universal if and only if the functor T carries couniversal objects of \mathcal{C} to universal objects of \mathcal{D} .*

Remark 8.2.4.7. Stated more informally, Theorem 8.2.4.6 states that if a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is corepresented by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ and a coupling $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ is represented by a functor $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$, then the objects of $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ can be identified with triples (T_-, T_+, α) where T_+ is a functor from \mathcal{C}_+ to \mathcal{D}_+ , and $\alpha : T_- \rightarrow G \circ T_+ \circ F$ is a natural transformation of functors from \mathcal{C}_- to \mathcal{D}_- . Moreover, the natural transformation α is an isomorphism if and only if the corresponding functor $\mathcal{C} \rightarrow \mathcal{D}$ carries couniversal objects to universal objects.

Example 8.2.4.8. Let \mathcal{C} and \mathcal{D} be ∞ -categories, let $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ and $(\mu_-, \mu_+) : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\text{op}} \times \mathcal{D}$ be the twisted arrow couplings of Example 8.2.0.2, and let

$$\text{ev} : \text{Fun}(\mathcal{C}, \mathcal{D}) \times \mathcal{C} \rightarrow \mathcal{D} \quad (F, C) \mapsto F(C)$$

be the evaluation functor. Passing to twisted arrow ∞ -categories, we obtain a map

$$\text{Tw}(\text{ev}) : \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) \times \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{D}),$$

which we can identify with a functor $\tilde{E} : \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) \rightarrow \text{Fun}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$. By construction, the functor \tilde{E} fits into a commutative diagram

$$\begin{array}{ccccc} \text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} & \xleftarrow{\quad} & \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) & \xrightarrow{\quad} & \text{Fun}(\mathcal{C}, \mathcal{D}) \\ \downarrow \circ \lambda_- & & \downarrow \tilde{E} & & \downarrow \circ \lambda_+ \\ \text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D}^{\text{op}}) & \xleftarrow{\mu_- \circ} & \text{Fun}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D})) & \xrightarrow{\mu_+ \circ} & \text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D}), \end{array}$$

and therefore determines a functor $E : \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) \rightarrow \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$. The commutative diagram

$$\begin{array}{ccc} \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) & \xrightarrow{E} & \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D})) \\ \downarrow & & \downarrow \Phi \\ \text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} \times \text{Fun}(\mathcal{C}, \mathcal{D}) & \xrightarrow{\text{id} \times \text{id}} & \text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} \times \text{Fun}(\mathcal{C}, \mathcal{D}) \end{array}$$

exhibits the coupling Φ as represented by the identity functor $\text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$.

Proof of Theorem 8.2.4.6. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling which is corepresented by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$, and let $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be a coupling which is represented by a functor $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$. It follows from Theorem 8.2.2.11 that the coupling

$$\Phi : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

of Remark 8.2.2.3 is representable, and that an object $(T_-, T, T_+) \in \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$ is universal if and only if the functor T carries couniversal objects of \mathcal{C} to universal objects of \mathcal{D} . We will complete the proof by showing that the coupling Φ is representable by the functor

$$H : \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-) \quad T_+ \mapsto G \circ T_+ \circ F.$$

Choose a morphism of couplings

$$\begin{array}{ccc} 045M & \mathcal{C} & \xrightarrow{\tilde{F}} \text{Tw}(\mathcal{C}_+) \\ & \downarrow \lambda & \downarrow \\ & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F^{\text{op}} \times \text{id}} \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ \end{array} \quad (8.40)$$

which exhibits λ as corepresented by F , and a morphism of couplings

$$\begin{array}{ccc} 045N & \text{Tw}(\mathcal{D}_+) & \xrightarrow{\tilde{G}} \mathcal{D} \\ & \downarrow & \downarrow \mu \\ & \mathcal{D}_+^{\text{op}} \times \mathcal{D}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array} \quad (8.41)$$

which exhibits μ as represented by G .

Let $E : \text{Tw}(\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \rightarrow \text{Fun}_\pm(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{D}_+))$ be the comparison map of Example 8.2.4.8. Precomposition with (8.40) and postcomposition with (8.41) determines a functor $E' : \text{Fun}_\pm(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{D}_+)) \rightarrow \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$ for which the diagram

$$\begin{array}{ccc} \text{Tw}(\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)) & \xrightarrow{E' \circ E} & \text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \\ \downarrow & & \downarrow \\ \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{H^{\text{op}} \times \text{id}} & \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \end{array}$$

is commutative. We will complete the proof by showing that this diagram exhibits the coupling Φ as represented by H .

Fix a functor $T_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$; we wish to show that the composite functor

$$\text{Tw}(\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \xrightarrow{E} \text{Fun}_\pm(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{D}_+)) \xrightarrow{E'} \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$$

carries id_{T_+} to a universal object of $\text{Fun}_\pm(\mathcal{C}, \mathcal{D})$. Unwinding the definitions, we see that the image of id_{T_+} is given by the triple $(G \circ T_+ \circ F, \tilde{G} \circ \text{Tw}(T_+) \circ \tilde{F}, T_+) \in \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$. Using the criterion of Theorem 8.2.2.11, we are reduced to showing that the composite functor

$$\mathcal{C} \xrightarrow{\tilde{F}} \text{Tw}(\mathcal{C}_+) \xrightarrow{\text{Tw}(T_+)} \text{Tw}(\mathcal{D}_+) \xrightarrow{\tilde{G}} \mathcal{D}$$

carries every couniversal object $X \in \mathcal{C}$ to a universal object of \mathcal{D} . Proposition 8.2.3.7 guarantees that $\tilde{F}(X) \in \text{Tw}(\mathcal{C}_+)$ corresponds to an isomorphism in \mathcal{C}_+ , so its image under $\text{Tw}(T_+)$ corresponds to an isomorphism in \mathcal{D}_+ ; the desired result now follows from our hypothesis that the functor \tilde{G} carries isomorphisms in \mathcal{D}_+ to universal objects of \mathcal{D} . \square

We close this section by recording an alternative formulation of Definition 8.2.4.1:

Proposition 8.2.4.9. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories, let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor, and suppose we are given a morphism of couplings*

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\ \downarrow \mu & & \downarrow \lambda \\ \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array} \quad \begin{matrix} 045P \\ 045Q \\ (8.42) \end{matrix}$$

where $\mu = (\mu_-, \mu_+)$ is the twisted arrow coupling of Example 8.2.0.2. The following conditions are equivalent:

- (1) The diagram (8.42) exhibits λ as represented by G , in the sense of Definition 8.2.4.1. That is, the functor \tilde{G} carries isomorphisms of \mathcal{C}_+ to universal objects of \mathcal{C} .
- (2) The functor \tilde{G} is left cofinal.

Proof. By virtue of Proposition 8.2.1.7, the functors λ_+ and μ_+ are cocartesian fibrations, and the functor \tilde{G} carries μ_+ -cocartesian morphisms of $\text{Tw}(\mathcal{C}_+)$ to λ_+ -cocartesian morphisms of \mathcal{C} . By virtue of Corollary 7.2.3.16, the functor \tilde{G} is left cofinal if and only if, for every object $C \in \mathcal{C}_+$, the induced map $\tilde{G}_C : \text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{C\} \rightarrow \mathcal{C} \times_{\mathcal{C}_+} \{C\}$ is left cofinal. It will therefore suffice to show that the following conditions are equivalent, for each object $C \in \mathcal{C}_+$.

- (1_C) The image $\tilde{G}(\text{id}_C)$ is a universal object of \mathcal{C} : that is, it is initial when viewed as an object of the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C\}$.
- (2_C) The functor \tilde{G}_C is left cofinal.

The equivalence (1_C) \Leftrightarrow (2_C) is a special case of Corollary 7.2.1.9, since id_C is initial when viewed as an object of the ∞ -category $\text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{C\}$ (see Proposition 8.1.2.1). \square

8.2.5 Adjunctions as Couplings

- 045R Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is both representable and corepresentable. Using Theorem 8.2.3.4 (and its dual), we can choose a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ which represents λ and a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which corepresents λ . Either of these functors determines the pairing λ up to equivalence, and therefore determines the other up to isomorphism. Our goal in this section is to establish the following more precise result:
- 045S **Theorem 8.2.5.1.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. Then a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ corepresents the coupling λ if and only if it is left adjoint to G .*

We first establish a weaker version of Theorem 8.2.5.1.

- 045T **Proposition 8.2.5.2.** *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. The following conditions are equivalent:*

- (1) *The coupling λ is corepresentable.*
- (2) *The functor G admits a left adjoint.*

Proof. By virtue of the criterion of Corollary 6.2.4.2, it will suffice to show that for each object $X \in \mathcal{C}_-$, the following conditions are equivalent:

- (1_X) There exists a couniversal object $\tilde{X} \in \mathcal{C}$ satisfying $\lambda_-(\tilde{X}) = X$.
- (2_X) The ∞ -category $(\mathcal{C}_-)_{X/} \times_{\mathcal{C}_-} \mathcal{C}_+$ has an initial object.

Note that Proposition 8.1.2.9 supplies an equivalence $(\mathcal{C}_-)_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-)$ of ∞ -categories which are left-fibered over \mathcal{C}_- . Restricting along the functor G , we obtain an equivalence of ∞ -categories

$$(\mathcal{C}_-)_{X/} \times_{\mathcal{C}_-} \mathcal{C}_+ \hookrightarrow \{X\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+.$$

Since λ is representable by G , there exists a categorical pullback square

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\widetilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- \end{array}$$

which induces an equivalence of ∞ -categories

$$\{X\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C} \rightarrow \{X\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+.$$

The equivalence of (1_X) and (2_X) now follows from Corollary 4.6.6.21. \square

Proof of Theorem 8.2.5.1. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{C}_+$. By virtue of Proposition 8.2.5.2, the functor G admits a left adjoint if and only if the coupling λ is corepresentable. If this condition is satisfied, then there exists a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which corepresents the coupling λ ; moreover, F is uniquely determined up to isomorphism (Theorem 8.2.0.4). We will complete the proof by showing that F is a left adjoint of G .

Choose a diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad \begin{array}{r} 045\text{U} \\ (8.43) \end{array}$$

which exhibits λ as represented by G (see Definition 8.2.3.5). Then, for each universal object $C \in \mathcal{C}$, the image $\tilde{G}(C) \in \text{Tw}(\mathcal{C}_-)$ corresponds to an isomorphism in the ∞ -category \mathcal{C}_- (Proposition 8.2.3.7). Using Proposition 8.2.4.3, we can choose a commutative diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_-) & \xrightarrow{\tilde{F}} & \mathcal{C} \\ \downarrow & & \downarrow \lambda \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- & \xrightarrow{\text{id} \times F} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \end{array} \quad \begin{array}{r} 045\text{V} \\ (8.44) \end{array}$$

which exhibits λ as corepresented by F (see Variant 8.2.4.5). It follows that the composite functor $\tilde{F} \circ \tilde{G} : \mathcal{C} \rightarrow \mathcal{C}$ carries universal objects of \mathcal{C} to couniversal objects of \mathcal{C} . Applying Theorem 8.2.4.6, we deduce that the diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F} \circ \tilde{G}} & \mathcal{C} \\ \downarrow \lambda & & \downarrow \lambda \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times (F \circ G)} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \end{array}$$

is couniversal when viewed as an object of the ∞ -category $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$.

In particular, there exists an (essentially unique) morphism

$$\tilde{\epsilon} : (\text{id}_{\mathcal{C}_-}, \tilde{F} \circ \tilde{G}, F \circ G) \rightarrow (\text{id}_{\mathcal{C}_-}, \text{id}_{\mathcal{C}}, \text{id}_{\mathcal{C}_+})$$

in the ∞ -category $\{\text{id}_{\mathcal{C}_-}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$. Let $\epsilon : F \circ G \rightarrow \text{id}_{\mathcal{C}_+}$ denote the image of $\tilde{\epsilon}$ under the forgetful functor $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{C}) \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{C}_+)$. We will show that ϵ is the counit of an adjunction between F and G .

Using Example 8.2.2.12, we see that the diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_-) & \xrightarrow{\text{id}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- & \xrightarrow{\text{id} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- \end{array}$$

is couniversal when viewed as an object of the ∞ -category $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_-), \text{Tw}(\mathcal{C}_-))$. In particular, there exists an (essentially unique) morphism

$$\tilde{\eta} : (\text{id}_{\mathcal{C}_-^{\text{op}}}, \text{id}_{\text{Tw}(\mathcal{C}_-)}, \text{id}_{\mathcal{C}_-}) \rightarrow (\text{id}_{\mathcal{C}_-^{\text{op}}}, \tilde{G} \circ \tilde{F}, G \circ F)$$

in the ∞ -category $\{\text{id}_{\mathcal{C}_-}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_-), \text{Tw}(\mathcal{C}_-))$. Let $\eta : \text{id}_{\mathcal{C}_+} \rightarrow G \circ F$ denote the image of $\tilde{\eta}$ under the forgetful functor $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_-), \text{Tw}(\mathcal{C}_-)) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{C}_-)$. We will complete the proof by showing that η is compatible with ϵ up to homotopy, in the sense of Definition 6.2.1.1. For this, we must verify the following:

(Z1) The identity isomorphism id_F is a composition of the natural transformations

$$F = F \circ \text{id}_{\mathcal{C}_-} \xrightarrow{\text{id} \circ \eta} F \circ G \circ F \xrightarrow{\epsilon \circ \text{id}} \text{id}_{\mathcal{C}_+} \times F = F$$

in the ∞ -category $\text{Fun}(\mathcal{C}_-, \mathcal{C}_+)$.

(Z2) The identity isomorphism id_G is a composition of the natural transformations

$$G = \text{id}_{\mathcal{C}_-} \circ G \xrightarrow{\eta \circ \text{id}} G \circ F \circ G \xrightarrow{\text{id} \circ \epsilon} G \times \text{id}_{\mathcal{C}_+} = G$$

in the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$.

Using Theorem 8.2.4.6, we deduce that the diagram (8.43) is a couniversal object of $\text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{C}_-))$: that is, it is initial when viewed as an object of the ∞ -category $\mathcal{E} = \{\text{id}_{\mathcal{C}_-}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{C}_-))$. It follows that the diagram

$$\begin{array}{ccc} & (\text{id}_{\mathcal{C}_-}, \tilde{G} \circ \tilde{F} \circ \tilde{G}, G \circ F \circ G) & \\ & \nearrow \tilde{\eta} \circ \text{id} & \searrow \text{id} \circ \tilde{\epsilon} \\ (\text{id}_{\mathcal{C}_-}, \tilde{G}, G) & \xrightarrow{\text{id}} & (\text{id}_{\mathcal{C}_-}, \tilde{G}, G) \end{array}$$

commutes up to homotopy in \mathcal{E} . Assertion (Z2) follows by applying the forgetful functor $\text{Fun}_\pm(\mathcal{C}, \text{Tw}(\mathcal{C}_-)) \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$. Assertion (Z1) follows by a similar argument, using the observation that the diagram (8.44) is a couniversal object of $\text{Fun}_\pm(\text{Tw}(\mathcal{C}_-), \mathcal{C})$ (Theorem 8.2.2.11). \square

8.2.6 Balanced Couplings

Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. In this section, we formulate a concrete criterion to determine if λ is representable (or corepresentable) by an equivalence of ∞ -categories.

Definition 8.2.6.1. Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{C}_+$ be a coupling of ∞ -categories. We say that λ is *balanced* if it satisfies the following conditions:

- (1) The coupling λ is representable. That is, for each object $C_+ \in \mathcal{C}_+$, there exists a universal object $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$.
- (2) The coupling λ is corepresentable. That is, for each object $C_- \in \mathcal{C}_-$, there exists a couniversal object $C \in \mathcal{C}$ satisfying $\lambda_-(C) = C_-$.
- (3) An object $C \in \mathcal{C}$ is universal if and only if it is couniversal.

Example 8.2.6.2. For every ∞ -category \mathcal{C} , the twisted arrow coupling $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \rightarrow \mathcal{C}$ of Example 8.2.0.2 is balanced. See Example 8.2.1.5.

Example 8.2.6.3. Let X be a Kan complex, let $\lambda_- : \text{Fun}(\Delta^1, X) \rightarrow X$ be the morphism given by evaluation at the vertex $0 \in \Delta^1$, and let $\lambda_+ : \text{Fun}(\Delta^1, X) \rightarrow X$ be the morphism given by evaluation at the vertex $1 \in \Delta^1$. It follows from Corollary 3.1.3.3 that the map

$$\lambda = (\lambda_-, \lambda_+) : \text{Fun}(\Delta^1, X) \rightarrow X \times X$$

is a Kan fibration; in particular, we can view it as a coupling of X with itself. For each vertex $x \in X$, the path spaces $\lambda_-^{-1}\{x\} = \{x\} \tilde{\times}_X X$ and $\lambda_+^{-1}\{x\} = X \tilde{\times}_X \{x\}$ are contractible Kan complexes (Example 3.4.1.13), so that every object of $\text{Fun}(\Delta^1, X)$ is both universal and couniversal for the coupling λ . In particular, λ is a balanced coupling.

Remark 8.2.6.4. Suppose we are given a morphism of couplings

04AW

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

which is an equivalence (in the sense of Exercise 8.2.2.7). Then λ is balanced if and only if μ is balanced. See Remark 8.2.2.8.

We can now formulate the main result of this section.

045Z **Theorem 8.2.6.5.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. The following conditions are equivalent:*

- (1) *The coupling λ is balanced.*
- (2) *The coupling λ is representable by an equivalence of ∞ -categories $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$.*
- (3) *The coupling λ is corepresentable by an equivalence of ∞ -categories $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$.*

04AX **Corollary 8.2.6.6.** *Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. Then \mathcal{C}_- and \mathcal{C}_+ are equivalent if and only if there exists a balanced coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$.*

0460 **Corollary 8.2.6.7.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. Then λ is balanced if and only if there exists an equivalence of couplings*

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \text{Tw}(\mathcal{D}) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}^{\text{op}} \times \mathcal{D}. \end{array}$$

Proof. Suppose that λ is balanced. By virtue of Theorem 8.2.6.5, the coupling λ is corepresentable by a functor $F_- : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which is an equivalence of ∞ -categories. We can therefore choose a categorical pullback square

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \text{Tw}(\mathcal{C}_+) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ \end{array}$$

which exhibits λ as corepresented by F_- . Since F_- is an equivalence of ∞ -categories, it follows that F is also an equivalence of ∞ -categories (Proposition 4.5.2.20). The reverse implication is an immediate consequence of Example 8.2.6.2 (and Remark 8.2.6.4). \square

We will deduce Theorem 8.2.6.5 from the following more general result.

Proposition 8.2.6.8. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. The following conditions are equivalent: 0461

- (1) Every universal object of \mathcal{C} is couniversal.
- (2) The functor G is fully faithful.

Proof. Using Proposition 8.2.4.3, we can choose a commutative diagram

$$\begin{array}{ccccc} \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}'} & \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow & & \downarrow \lambda & & \downarrow \\ \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad \begin{matrix} 0462 \\ (8.45) \end{matrix}$$

where the left square exhibits λ as represented by G in the sense of Definition 8.2.4.1, and the right square exhibits λ as represented by G in the sense of Definition 8.2.3.5. Invoking (the dual of) Lemma 8.2.3.6, we see that (1) is equivalent to the following:

- (1') The left square of (8.45) is a categorical pullback diagram.

For each object $C \in \mathcal{C}_+$, Proposition 8.2.3.7 guarantees that the composite functor $\tilde{G} \circ \tilde{G}'$ carries id_C to an isomorphism of \mathcal{C}_- (regarded as an object of $\text{Tw}(\mathcal{C}_-)$). It follows from Theorem 8.2.2.11 that $(G, \tilde{G}' \circ \tilde{G}, G)$ and $(G, \text{Tw}(G), G)$ are isomorphic when viewed as objects of $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-))$ (since both are initial objects of the ∞ -category $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)} \{G\}$). In particular, for every pair of objects $X, Y \in \mathcal{C}_+$, the diagram of Kan complexes

$$\begin{array}{ccc} \text{Hom}_{\mathcal{C}_+}(X, Y) & \longrightarrow & \{X\} \times_{\mathcal{C}_+^{\text{op}}} \text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{Y\} \\ \downarrow G & & \downarrow \tilde{G}' \circ \tilde{G} \\ \text{Hom}_{\mathcal{C}_-}(G(X), G(Y)) & \longrightarrow & \{G(X)\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \{G(Y)\} \end{array}$$

commutes up to homotopy, where the horizontal maps are the homotopy equivalences of Notation 8.1.2.14. Using Corollary 5.1.7.15, we see that (2) is equivalent to the following:

- (2') The outer rectangle of (8.45) is a categorical pullback diagram.

The equivalence of (1') and (2') is a special case of Proposition 4.5.2.17, since the right square of (8.45) is a categorical pullback square by assumption. \square

Proof of Theorem 8.2.6.5. We will prove the equivalence $(1) \Leftrightarrow (2)$; the equivalence $(1) \Leftrightarrow (3)$ follows by a similar argument. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. Combining Theorem 8.2.5.1 with Proposition 8.2.6.8, we see that λ is balanced if and only if the following conditions are satisfied:

- The functor G is fully faithful.
- The functor G admits a left adjoint $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$.
- The functor F is fully faithful.

It follows from Corollary 6.3.3.14 that these conditions are satisfied if and only if G is an equivalence of ∞ -categories. \square

We close this section by describing an example of a balanced coupling which will play an important role in §8.6.

04AY **Proposition 8.2.6.9.** *Let \mathcal{C} be an ∞ -category and let $\text{ev}_0, \text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ be the evaluation functors. Let L be the collection of all morphisms u in $\text{Fun}(\Delta^1, \mathcal{C})$ such that $\text{ev}_0(u)$ is an isomorphism in \mathcal{C} , and let R be the collection of all morphisms u in $\text{Fun}(\Delta^1, \mathcal{C})$ such that $\text{ev}_1(u)$ is an isomorphism in \mathcal{C} . Then the maps $\text{Cospan}(\text{ev}_0)$ and $\text{Cospan}(\text{ev}_1)$ determine a balanced coupling*

$$\lambda : \text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C})) \rightarrow \text{Fun}^{\text{iso},\text{all}}(\mathcal{C}) \times \text{Fun}^{\text{all},\text{iso}}(\mathcal{C}).$$

The proof of Proposition 8.2.6.9 will require some preliminaries. The first step is to establish the following:

04AZ **Lemma 8.2.6.10.** *Let \mathcal{C} be an ∞ -category. Then the morphism*

$$\lambda : \text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C})) \rightarrow \text{Fun}^{\text{iso},\text{all}}(\mathcal{C}) \times \text{Fun}^{\text{all},\text{iso}}(\mathcal{C})$$

is a left fibration of ∞ -categories.

The proof of Lemma 8.2.6.10 is straightforward but somewhat tedious; we therefore defer the argument to §8.6.6, where we prove a more general statement (Lemma 8.6.5.14). It follows from Lemma 8.2.6.10 that we can view the map

$$\lambda : \text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C})) \rightarrow \text{Fun}^{\text{iso},\text{all}}(\mathcal{C}) \times \text{Fun}^{\text{all},\text{iso}}(\mathcal{C})$$

as a coupling of the ∞ -category $\text{Fun}^{\text{all},\text{iso}}(\mathcal{C}) \simeq \text{Fun}^{\text{iso},\text{all}}(\mathcal{C})^{\text{op}}$ with itself (see Remark 8.1.6.2). To deduce Proposition 8.2.6.9, we will compare λ with the twisted arrow coupling $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Example 8.2.0.2.

Construction 8.2.6.11. Let Q be a partially ordered set and let Q^{op} denote the opposite partially ordered set. To avoid confusion, for each element $q \in Q$, we write q^{op} for the corresponding element of Q^{op} . Let $\text{Tw}(Q)$ denote the twisted arrow category of Q (Example 8.1.0.5), which we identify with the partially ordered subset of $Q^{\text{op}} \times Q$ consisting of those pairs (p^{op}, q) satisfying $p \leq q$. We then have a morphism of partially ordered sets $\xi_Q : \text{Tw}(Q) \times [1] \rightarrow Q^{\text{op}} \star Q$, given concretely by the formulae

$$\xi_Q(p^{\text{op}}, q, i) = \begin{cases} p^{\text{op}} & \text{if } i = 0 \\ q & \text{if } i = 1. \end{cases}$$

Let \mathcal{C} be a simplicial set. For every nonempty finite linearly ordered set Q , we obtain a map

$$\begin{aligned} \text{Hom}_{\text{Set}_{\Delta}}(\text{N}_{\bullet}(Q), \text{Tw}(\mathcal{C})) &\simeq \text{Hom}_{\text{Set}_{\Delta}}(\text{N}_{\bullet}(Q^{\text{op}} \star Q), \mathcal{C}) \\ &\xrightarrow{\circ \xi_Q} \text{Hom}_{\text{Set}_{\Delta}}(\text{N}_{\bullet}(\text{Tw}(Q) \times [1]), \mathcal{C}) \\ &\simeq \text{Hom}_{\text{Set}_{\Delta}}(\text{Tw}(\text{N}_{\bullet}(Q)) \times \Delta^1, \mathcal{C}) \\ &\simeq \text{Hom}_{\text{Set}_{\Delta}}(\text{Tw}(\text{N}_{\bullet}(Q)), \text{Fun}(\Delta^1, \mathcal{C})) \\ &\simeq \text{Hom}_{\text{Set}_{\Delta}}(\text{N}_{\bullet}(Q), \text{Cospan}(\text{Fun}(\Delta^1, \mathcal{C}))). \end{aligned}$$

This construction depends functorially on Q , and therefore determines a morphism of simplicial sets $\Xi : \text{Tw}(\mathcal{C}) \rightarrow \text{Cospan}(\text{Fun}(\Delta^1, \mathcal{C}))$.

Remark 8.2.6.12. Let \mathcal{C} be a simplicial set. Then the morphism Ξ of Construction 8.2.6.11 04B1 can be described concretely on low-dimensional simplices as follows:

- On vertices, Ξ is given by the formula $\Xi(f) = f$. Here we abuse notation by identifying vertices of $\text{Tw}(\mathcal{C})$ and $\text{Cospan}(\text{Fun}(\Delta^1, \mathcal{C}))$ with edges of the simplicial set \mathcal{C} .
- Let $e : f_0 \rightarrow f_1$ be an edge of the simplicial set $\text{Tw}(\mathcal{C})$, which we identify with a 3-simplex σ of \mathcal{C} displayed informally in the diagram

$$\begin{array}{ccc} X_0 & \xleftarrow{g} & X_1 \\ \downarrow f_0 & & \downarrow f_1 \\ Y_0 & \xrightarrow{h} & Y_1. \end{array}$$

Then $\Xi(e)$ is the cospan from f_0 to f_1 in the simplicial set $\text{Fun}(\Delta^1, \mathcal{C})$ depicted

informally in the diagram

$$\begin{array}{ccccc}
 X_0 & \xrightarrow{\text{id}} & X_0 & \xleftarrow{g} & X_1 \\
 \downarrow f_0 & & \downarrow & & \downarrow f_1 \\
 Y_0 & \xrightarrow{h} & Y_1 & \xleftarrow{\text{id}} & Y_1.
 \end{array}$$

Let \mathcal{C} be an ∞ -category. It follows from Remark 8.2.6.12 that the morphism $\Xi : \text{Tw}(\mathcal{C}) \rightarrow \text{Cospan}(\text{Fun}(\Delta^1, \mathcal{C}))$ of Construction 8.2.6.11 factors through the simplicial subset $\text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C})) \subseteq \text{Cospan}(\text{Fun}(\Delta^1, \mathcal{C}))$ appearing in the statement of Proposition 8.2.6.9. Unwinding the definitions, we obtain a morphism of couplings

$$\begin{array}{ccc}
 \text{Tw}(\mathcal{C}) & \xrightarrow{\Xi} & \text{Cospan}^{L,R}(\mathcal{C}) \\
 \downarrow & & \downarrow \lambda \\
 \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{\rho_- \times \rho_+} & \text{Cospan}^{\text{iso},\text{all}}(\mathcal{C}) \times \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})
 \end{array} \tag{8.46}$$

where the vertical maps are the left fibrations of Proposition 8.1.1.11 and Lemma 8.2.6.10, and ρ_+ and ρ_- are given by Construction 8.1.7.1 and Variant 8.1.7.14. By virtue of Remark 8.2.6.4, Proposition 8.2.6.9 is a consequence of the following more precise result:

04B3 Proposition 8.2.6.13. *Let \mathcal{C} be an ∞ -category. Then the diagram (8.46) is an equivalence of couplings (in the sense of Exercise 8.2.2.7)*

Proof. It follows from Proposition 8.1.7.6 that the inclusion maps

$$\rho_- : \mathcal{C}^{\text{op}} \hookrightarrow \text{Cospan}^{\text{iso},\text{all}}(\mathcal{C}) \quad \rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$$

are equivalences of ∞ -categories. By virtue of Corollary 5.1.7.15, it will suffice to show that for every pair of objects $X, Y \in \mathcal{C}$, the morphism Ξ induces a homotopy equivalence of Kan complexes

$$\Xi_{X,Y} : \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \text{Cospan}(\text{Hom}_{\mathcal{C}}(X, Y)).$$

We complete the proof by observing that $\Xi_{X,Y}$ fits into a commutative diagram of Kan complexes

$$\begin{array}{ccc}
 \text{Hom}_{\mathcal{C}}^L(X, Y) & \longrightarrow & \text{Hom}_{\mathcal{C}}(X, Y) \\
 \downarrow & & \downarrow \\
 \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} & \xrightarrow{\Xi_{X,Y}} & \text{Cospan}(\text{Hom}_{\mathcal{C}}(X, Y))
 \end{array}$$

where the left vertical map is the homotopy equivalence of Corollary 8.1.2.10, the right vertical map is the homotopy equivalence of Example 8.1.7.7, and the upper horizontal map is the homotopy equivalence of Proposition 4.6.5.9. \square

Corollary 8.2.6.14. *Let \mathcal{C} be an ∞ -category and let f be a morphism of \mathcal{C} . Then f is an isomorphism if and only if it is universal with respect to the balanced coupling*

$$\lambda : \text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C})) \rightarrow \text{Fun}^{\text{iso},\text{all}}(\mathcal{C}) \times \text{Fun}^{\text{all},\text{iso}}(\mathcal{C})$$

of Proposition 8.2.6.9 (where we abuse notation by identifying f with an object of the ∞ -category $\text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C}))$).

Proof. Let us abuse notation further by identifying f with an object of the twisted arrow ∞ -category $\text{Tw}(\mathcal{C})$, so that the comparison functor $\Xi : \text{Tw}(\mathcal{C}) \rightarrow \text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C}))$ of Construction 8.2.6.11 satisfies $\Xi(f) = f$ (Remark 8.2.6.12). By virtue of Proposition 8.2.6.13 and Remark 8.3.2.8, we are reduced to showing that f is an isomorphism if and only if it is universal with respect to the twisted arrow coupling $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$, which follows from Example 8.2.1.5. \square

8.3 The Yoneda Embedding

Let \mathcal{C} be a category. For every object $X \in \mathcal{C}$, we let $h^X : \mathcal{C} \rightarrow \text{Set}$ denote the functor corepresented by X , given on objects by the formula $h^X(Y) = \text{Hom}_{\mathcal{C}}(X, Y)$. The construction $X \mapsto h^X$ determines a functor from \mathcal{C}^{op} to the functor category $\text{Fun}(\mathcal{C}, \text{Set})$, which we refer to as the (*contravariant*) *Yoneda embedding*. This terminology is justified by the following:

Proposition 8.3.0.1 (Yoneda's Lemma, Weak Form). *For any (locally small) category \mathcal{C} , the Yoneda embedding*

$$\mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \text{Set}) \quad X \mapsto h^X$$

is fully faithful.

The goal of this section is to extend Proposition 8.3.0.1 to the setting of ∞ -categories. Our first step is to construct an analogue of the functor $X \mapsto h^X$. For every pair of objects $X, Y \in \mathcal{C}$, the morphism space $\text{Hom}_{\mathcal{C}}(X, Y)$ is a Kan complex (Proposition 4.6.1.10), which we can regard as an object of the ∞ -category \mathcal{S} . In §8.3.3, we show that the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ can be upgraded to a functor from the product $\mathcal{C}^{\text{op}} \times \mathcal{C}$ to the ∞ -category \mathcal{S} . More precisely, every locally small ∞ -category \mathcal{C} admits a Hom-functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$, which is characterized (up to isomorphism) by the requirement that it is a covariant transport representation for the twisted arrow fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of

Proposition 8.3.3.2. This condition guarantees that for every object $X \in \mathcal{C}$, the functor $\mathcal{H}(X, -) : \mathcal{C} \rightarrow \mathcal{S}$ is corepresentable by X . We can therefore identify \mathcal{H} with a functor

$$h^\bullet : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}) \quad X \mapsto \mathcal{H}(X, -)$$

carrying each object of \mathcal{C} to a functor that it corepresents; we will refer to h^\bullet as a *contravariant Yoneda embedding* for \mathcal{C} (Definition 8.3.3.9).

To show that the Yoneda embedding is fully faithful, we will need an additional ingredient. Let us return to the situation where \mathcal{C} is an ordinary category. Proposition 8.3.0.1 asserts that for every pair of objects $X, Y \in \mathcal{C}$, the natural map $\text{Hom}_{\mathcal{C}}(Y, X) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}, \text{Set})}(h^X, h^Y)$ is a bijection. It is easy to see that this map is injective: in fact, it has a left inverse $T : \text{Hom}_{\text{Fun}(\mathcal{C}, \text{Set})}(h^X, h^Y) \rightarrow \text{Hom}_{\mathcal{C}}(Y, X)$, which carries a natural transformation $\alpha : h^X \rightarrow h^Y$ to the element $\alpha_X(\text{id}_X) \in h^Y(X) = \text{Hom}_{\mathcal{C}}(Y, X)$. It will therefore suffice to show that T is bijective. This is a consequence of the following *strong* version of Yoneda's lemma: for every functor $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}$, the evaluation map

$$\text{Hom}_{\text{Fun}(\mathcal{C}, \text{Set})}(h^X, \mathcal{F}) \rightarrow \mathcal{F}(X) \quad \alpha \mapsto \alpha_X(\text{id}_X)$$

is a bijection (Proposition 8.3.1.1). This assertion also has a counterpart in the setting of ∞ -categories (Proposition 8.3.1.3), which we formulate and prove in §8.3.1.

To exploit the universal mapping property of (co)representable functors, it will be convenient to introduce some terminology. Let \mathcal{C} and \mathcal{D} be ∞ -categories. We define a *profunctor from \mathcal{D} to \mathcal{C}* to be a functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ (Definition 8.3.2.1). We say that a profunctor \mathcal{H} is *corepresentable* if, for every object $X \in \mathcal{C}$, the functor $\mathcal{H}(X, -) : \mathcal{D} \rightarrow \mathcal{S}$ is corepresentable. In this case, the construction $X \mapsto \mathcal{H}(X, -)$ determines a functor from \mathcal{C}^{op} to the full subcategory $\text{Fun}^{\text{corep}}(\mathcal{D}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{D}, \mathcal{S})$ spanned by the corepresentable functors. In §8.3.2, we establish a criterion for this functor to be an equivalence of ∞ -categories (Corollary 8.3.2.20). Our ∞ -categorical version of Yoneda's lemma then follows by specializing this criterion to the situation where $\mathcal{C} = \mathcal{D}$ and \mathcal{H} is a Hom-functor (Theorem 8.3.3.13).

Let \mathcal{C} and \mathcal{D} be ∞ -categories. Assume that \mathcal{C} is locally small, so that it admits a Hom-functor $\mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$. For every functor $G : \mathcal{D} \rightarrow \mathcal{C}$, the composition

$$\mathcal{C}^{\text{op}} \times \mathcal{D} \xrightarrow{\text{id} \times G} \mathcal{C}^{\text{op}} \times \mathcal{C} \xrightarrow{\mathcal{H}} \mathcal{S},$$

can be regarded as a profunctor \mathcal{H}_G from \mathcal{D} to \mathcal{C} , given informally by the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{D}}(X, G(Y))$. In §8.3.4, we show that this construction determines a fully faithful functor $\text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \mathcal{S})$, whose essential image is spanned by the *representable* profunctors (Proposition 8.3.4.1). Using the results of §8.2, we give an alternative characterization of representable profunctors (Proposition 8.3.4.15) and show that they satisfy a universal mapping property (Corollary 8.3.4.21). As an application, we

show that morphism spaces in the ∞ -category $\text{Fun}(\mathcal{D}, \mathcal{C})$ can be computed as limits indexed by the twisted arrow ∞ -category $\text{Tw}(\mathcal{D})$ (Example 8.3.4.22).

Warning 8.3.0.2. If \mathcal{C} is an ordinary category, the Yoneda embedding

03M1

$$h^\bullet : \mathcal{C}^{\text{op}} \hookrightarrow \text{Fun}(\mathcal{C}, \text{Set}) \quad X \mapsto h^X$$

is given by a completely explicit construction. Beware that in the ∞ -categorical setting, the Yoneda embedding depends on a choice of covariant transport representation for the twisted arrow fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$, which is well-defined only up to isomorphism. However, it is sometimes possible to eliminate this ambiguity. Suppose that $\mathcal{C} = N_\bullet^{\text{hc}}(\mathcal{C}_0)$ is the homotopy coherent nerve of a locally Kan simplicial category \mathcal{C}_0 . In this case, the simplicial enrichment of \mathcal{C}_0 determines a functor of simplicial categories

$$\mathcal{C}_0^{\text{op}} \times \mathcal{C}_0 \rightarrow \text{Kan} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}_0}(X, Y)_\bullet.$$

Passing to the homotopy coherent nerve, we obtain a functor of ∞ -categories $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ (Construction 8.3.6.1). In §8.3.6, we show that \mathcal{H} is a Hom-functor for the ∞ -category \mathcal{C} (Proposition 8.3.6.2). Our proof uses a recognition principle for Hom-functors, which we formulate and prove in §8.3.5.

8.3.1 Yoneda's Lemma

Let \mathcal{C} be a category. Every object $X \in \mathcal{C}$ determines a corepresentable functor $h^X : \mathcal{C} \rightarrow \text{Set}$, given on objects by the formula $h^X(Y) = \text{Hom}_{\mathcal{C}}(X, Y)$. This functor can be characterized by a universal mapping property:

Proposition 8.3.1.1 (Yoneda's Lemma, Strong Form). *Let \mathcal{C} be a category containing an object X . For every functor $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}$, evaluation on the identity morphism $\text{id}_X \in h^X(X)$ induces a bijection*

$$\text{Hom}_{\text{Fun}(\mathcal{C}, \text{Set})}(h^X, \mathcal{F}) \rightarrow \mathcal{F}(X).$$

Proof. Fix an element $x \in \mathcal{F}(X)$. We wish to show that there is a unique natural transformation $\alpha : h^X \rightarrow \mathcal{F}$ which carries $\text{id}_X \in h^X(X)$ to the element $x \in \mathcal{F}(X)$.

For any object $Y \in \mathcal{C}$, every element $f \in h^X(Y) \in \text{Hom}_{\mathcal{C}}(X, Y)$ can be obtained by evaluating the function $h^X(f) : h^X(X) \rightarrow h^X(Y)$ on the object id_X . It follows that, if $\alpha : h^X \rightarrow \mathcal{F}$ is a natural transformation satisfying $\alpha_X(\text{id}_X) = x$, then it must satisfy the identity

$$\alpha_Y(f) = \alpha_Y(h^X(f)(\text{id}_X)) = \mathcal{F}(f)(h_X(\text{id}_X)) = \mathcal{F}(f)(x).$$

This proves uniqueness. To establish existence, it will suffice to show that the collection of functions

$$\alpha_Y : \text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathcal{F}(Y) \quad f \mapsto \mathcal{F}(f)(x)$$

determine a natural transformation from h^X to \mathcal{F} . In other words, we must show that for each morphism $g : Y \rightarrow Z$ in \mathcal{C} , the diagram of sets

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{C}}(X, Y) & \xrightarrow{g \circ} & \mathrm{Hom}_{\mathcal{C}}(X, Z) \\ \downarrow \alpha_Y & & \downarrow \alpha_Z \\ \mathcal{F}(Y) & \xrightarrow{\mathcal{F}(g)} & \mathcal{F}(Z) \end{array}$$

is commutative. This follows from the observation that, for every morphism $f : X \rightarrow Y$ of \mathcal{C} , we have an equality $\mathcal{F}(g \circ f)(x) = (\mathcal{F}(g) \circ \mathcal{F}(f))(x)$ in the set $\mathcal{F}(Z)$. \square

Our goal in this section is prove a generalization of Yoneda's lemma, where we replace \mathcal{C} by an ∞ -category and Set by the ∞ -category \mathcal{S} of spaces (Proposition 8.3.1.3). In the ∞ -categorical setting, the proof is more subtle: to construct a natural transformation α between functors $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$, it is not enough to specify a collection of morphisms $\{\alpha_Y : \mathcal{G}(Y) \rightarrow \mathcal{F}(Y)\}_{Y \in \mathcal{C}}$ and to verify a compatibility condition. To address this difficulty, we will use the formalism of Kan extensions developed in §7.3 (see Lemma 8.3.1.7).

03M4 **Notation 8.3.1.2.** Let \mathcal{S} denote the ∞ -category of spaces (Construction 5.6.1.1). Let \mathcal{C} be an ∞ -category and suppose we are given a pair of functors $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$. Fix an object $X \in \mathcal{C}$ and a vertex $\eta \in \mathcal{F}(X)$. We then obtain a comparison morphism

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G}) &\xrightarrow{\mathrm{ev}_X} \mathrm{Hom}_{\mathcal{S}}(\mathcal{F}(X), \mathcal{G}(X)) \\ &\xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{G}(X)) \\ &\simeq \mathcal{G}(X) \end{aligned}$$

in the homotopy category hKan , where the first map is given by evaluation on the object X , the second by the composition law of Notation 4.6.8.15, and the third is (the inverse of) the homotopy equivalence of Remark 5.6.1.5.

03M5 **Proposition 8.3.1.3** (∞ -Categorical Yoneda Lemma). *Let \mathcal{C} be an ∞ -category containing an object X , let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let $\eta \in \mathcal{F}(X)$ be a vertex which exhibits the functor \mathcal{F} as corepresented by X (see Definition 5.7.6.1). Then, for every functor $\mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$, the comparison map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{G}(X)$$

of Notation 8.3.1.2 is an isomorphism in the homotopy category hKan .

03M6 **Remark 8.3.1.4.** In the special case where \mathcal{C} is (the nerve of) an ordinary category and \mathcal{G} is a set-valued functor, Proposition 8.3.1.3 reduces to Proposition 8.3.1.1.

Remark 8.3.1.5. Let \mathcal{C} be a locally small ∞ -category and let X be an object of \mathcal{C} . In §5.7.6, we proved that there exists a functor $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ which is corepresented by X , and that \mathcal{F} is uniquely determined up to isomorphism (Theorem 5.7.6.13). Proposition 8.3.1.3 can be regarded as a more refined version of this uniqueness assertion: the functor \mathcal{F} is characterized, up to isomorphism, by the requirement that it corepresents the evaluation functor

$$\text{ev}_X : \text{Fun}(\mathcal{C}, \mathcal{S}) \rightarrow \mathcal{S} \quad \mathcal{G} \mapsto \mathcal{G}(X).$$

Corollary 8.3.1.6. Let \mathcal{C} be an ∞ -category containing an object X . Suppose that, for every object $Y \in \mathcal{C}$, the Kan complex $\text{Hom}_{\mathcal{C}}(X, Y)$ is essentially small (this condition is satisfied, for example, if \mathcal{C} is small). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let η be a vertex of the Kan complex $\mathcal{F}(X)$. The following conditions are equivalent:

- (1) The vertex η exhibits the functor \mathcal{F} as corepresented by X , in the sense of Definition 5.7.6.1.
- (2) For every functor $\mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$, the comparison map of Notation 8.3.1.2 is a homotopy equivalence $\text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{G}(X)$.
- (3) For every functor $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$, the comparison map of Notation 8.3.1.2 induces a bijection $\pi_0(\text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G})) \rightarrow \pi_0(\mathcal{G}(X))$.

Proof. The implication (1) \Rightarrow (2) follows from Proposition 8.3.1.3, and the implication (2) \Rightarrow (3) is immediate. We will complete the proof by showing that (3) implies (1). Our assumption that the morphism space $\text{Hom}_{\mathcal{C}}(X, Y)$ is essentially small for each $Y \in \mathcal{C}$ guarantees that there exists a functor $\mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ and a vertex $\eta' \in \mathcal{F}'(X)$ which exhibits \mathcal{F}' as corepresented by X (see Theorem 5.7.6.13). Applying assumption (3), we deduce that there exists a natural transformation $\alpha : \mathcal{F}' \rightarrow \mathcal{F}$ such that $\alpha_X(\eta')$ and η lie in the same connected component of \mathcal{F}' . Since the pair (\mathcal{F}', η') also satisfies condition (3), composition with α induces a bijection $\pi_0(\text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G})) \rightarrow \pi_0(\text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}', \mathcal{G}))$ for each object $\mathcal{G} \in \text{Fun}(\mathcal{C}, \mathcal{S})$. It follows that α is an isomorphism. Applying Remark 5.7.6.4, we deduce that $\alpha_X(\eta') \in \mathcal{F}(X)$ exhibits the functor \mathcal{F} as corepresented by X . Since η and $\alpha_X(\eta')$ belong to the same connected component of $\mathcal{F}(X)$, it follows that η has the same property (Remark 5.7.6.3). \square

Proposition 8.3.1.3 is an easy consequence of the following:

Lemma 8.3.1.7. Let \mathcal{C} be an ∞ -category containing an object X , let κ be an uncountable cardinal, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ be a functor, and let $\eta \in \mathcal{F}(X)$ be a vertex. The following conditions are equivalent:

- (1) The vertex η exhibits \mathcal{F} as corepresented by the object X , in the sense of Definition 5.7.6.1.

- (2) Let $\iota : \{X\} \hookrightarrow \mathcal{C}$ denote the inclusion map and let $\mathcal{F}_0 : \{X\} \rightarrow \mathcal{S}$ denote the constant functor taking the value Δ^0 , so that η can be regarded as a natural transformation from \mathcal{F}_0 to the composite functor $\mathcal{F} \circ \iota$. Then η exhibits \mathcal{F} as a left Kan extension of \mathcal{F}_0 along ι , in the sense of Variant 7.3.1.5. Moreover, for each object $Y \in \mathcal{C}$, the mapping space $\text{Hom}_{\mathcal{C}}(X, Y)$ is essentially κ -small.

Proof. Fix an object $Y \in \mathcal{C}$ and set $M = \text{Hom}_{\mathcal{C}}(X, Y)$. We may assume without loss of generality that M is essentially κ -small (this follows immediately from condition (2), and also follows from (1) since the Kan complex $\mathcal{F}(Y)$ is essentially small). For every Kan complex K , let \underline{K}_M denote the constant functor $M \rightarrow \mathcal{S}$ taking the value K , so that the functor \mathcal{F} determines a natural transformation $\gamma : \underline{\mathcal{F}(X)}_M \rightarrow \underline{\mathcal{F}(Y)}_M$. We will show that the following pair of conditions is equivalent:

- (1_Y) The composite map

$$\text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{S}}(\mathcal{F}(X), \mathcal{F}(Y)) \xrightarrow{\circ[\eta]} \text{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{F}(Y))$$

is a homotopy equivalence of Kan complexes.

- (2_Y) The composite natural transformation

$$\underline{\Delta^0}_M \xrightarrow{\eta} \underline{\mathcal{F}(X)}_M \xrightarrow{\gamma} \underline{\mathcal{F}(Y)}_M$$

exhibits $\mathcal{F}(Y)$ as a colimit of the constant diagram $\underline{\Delta^0}|_M$ in the ∞ -category \mathcal{S} .

The equivalence of (1_Y) and (2_Y) is a special case of Proposition 7.6.2.9 (see Example 7.6.2.11). Lemma 8.3.1.7 follows by allowing the object $Y \in \mathcal{C}$ to vary. \square

Proof of Proposition 8.3.1.3. Combine Lemma 8.3.1.7 and 7.3.6.1. \square

For later use, let us record another consequence of Lemma 8.3.1.7.

04B5 **Corollary 8.3.1.8.** *Let κ be an uncountable cardinal, let $T : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between locally κ -small ∞ -categories, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ and $\mathcal{G} : \mathcal{D} \rightarrow \mathcal{S}^{<\kappa}$ be functors, and let $\beta : \mathcal{F} \rightarrow \mathcal{G} \circ T$ be a natural transformation of functors from \mathcal{C} to \mathcal{S} . Fix an object $C \in \mathcal{C}$ and a vertex $\eta \in \mathcal{F}(C)$ which exhibits the functor \mathcal{F} as corepresented by C . The following conditions are equivalent:*

- (1) *The natural transformation β carries η to a vertex of $\mathcal{G}(T(C))$ which exhibits the functor \mathcal{G} as corepresented by the object $T(C) \in \mathcal{D}$.*
- (2) *The natural transformation β exhibits \mathcal{G} as a left Kan extension of \mathcal{F} along the functor T (see Variant 7.3.1.5).*

Proof. Combine Lemma 8.3.1.7 with Proposition 7.3.8.18. \square

Corollary 8.3.1.9. *Let κ be an uncountable cardinal, let $T : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between 04B6 locally κ -small ∞ -categories and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor which is corepresented by an object $C \in \mathcal{C}$. Then a functor $\mathcal{G} : \mathcal{D} \rightarrow \mathcal{S}$ is a left Kan extension of \mathcal{F} along T if and only if it is corepresentable by the object $T(C) \in \mathcal{D}$.*

Proof. Assume that \mathcal{G} is corepresentable by $T(C)$; we will show that it is a left Kan extension of \mathcal{F} along T (the reverse implication follows immediately from Corollary 8.3.1.8). Fix a vertex $\eta \in \mathcal{F}(C)$ which exhibits \mathcal{F} as corepresented by C . It follows from Proposition 8.3.1.3 that evaluation at η induces a homotopy equivalence of Kan complexes

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G} \circ T) \rightarrow \mathcal{G}(T(C)).$$

We can therefore choose a natural transformation $\beta : \mathcal{F} \rightarrow \mathcal{G} \circ T$ which carries η to a vertex which exhibits \mathcal{G} as corepresented by $T(C)$. Applying Corollary 8.3.1.8, we see that β exhibits \mathcal{G} as a left Kan extension of \mathcal{F} along T . \square

8.3.2 Profunctors of ∞ -Categories

Let \mathcal{C}_- and \mathcal{C}_+ be categories. A *profunctor* from \mathcal{C}_+ to \mathcal{C}_- is a Set-valued functor on 03MA the product category $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. This notion has an evident ∞ -categorical analogue, where we replace the ordinary category of sets by the ∞ -category \mathcal{S} of spaces (see Construction 5.6.1.1).

Definition 8.3.2.1. Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. A *profunctor* from \mathcal{C}_+ to \mathcal{C}_- is a 03MB functor $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$.

Example 8.3.2.2. Let \mathcal{C}_- and \mathcal{C}_+ be ordinary categories. Then every functor $K : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathrm{Set}$ determines a morphism of simplicial sets

$$\mathrm{N}_\bullet(K) : \mathrm{N}_\bullet(\mathcal{C}_-)^{\mathrm{op}} \times \mathrm{N}_\bullet(\mathcal{C}_+) \rightarrow \mathrm{N}_\bullet(\mathrm{Set}) \subset \mathcal{S}.$$

This construction determines a monomorphism from the collection of profunctors from \mathcal{C}_+ to \mathcal{C}_- (in the sense of classical category theory) to the collection of profunctors from $\mathrm{N}_\bullet(\mathcal{C}_+)$ to $\mathrm{N}_\bullet(\mathcal{C}_-)$ (in the sense of Definition 8.3.2.1). Beware that this map is (usually) not bijective: its image consists of those profunctors

$$\mathcal{K} : \mathrm{N}_\bullet(\mathcal{C}_-)^{\mathrm{op}} \times \mathrm{N}_\bullet(\mathcal{C}_+) \rightarrow \mathcal{S}$$

having the property that for every pair of objects $X \in \mathcal{C}_-$ and $Y \in \mathcal{C}_+$, the Kan complex $\mathcal{K}(X, Y)$ is a constant simplicial set (see Proposition 1.2.2.1 and Remark 5.6.1.7).

03MD **Remark 8.3.2.3** (Symmetry). Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from \mathcal{C}_+ to \mathcal{C}_- . Then, by transposing its arguments, we can also regard \mathcal{K} as a profunctor from $\mathcal{C}_-^{\text{op}}$ to $\mathcal{C}_+^{\text{op}}$.

0463 **Example 8.3.2.4** (From Profunctors to Couplings). Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories, let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from \mathcal{C}_+ to \mathcal{C}_- (Definition 8.3.2.1). Applying the construction of Definition 5.7.2.1, we obtain an ∞ -category $\int_{\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+} \mathcal{K}$ whose objects are triples (X, Y, η) where X is an object of \mathcal{C}_- , Y is an object of \mathcal{C}_+ , and η is a vertex of the Kan complex $\mathcal{K}(X, Y)$. This ∞ -category is equipped with a left fibration

$$\lambda : \int_{\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+} \mathcal{K} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+,$$

given on objects by the construction $\lambda(X, Y, \eta) = (X, Y)$ (see Example 5.7.2.9). The left fibration λ is a coupling of \mathcal{C}_+ with \mathcal{C}_- , in the sense of Definition 8.2.0.1; we will refer to it as the *coupling associated to the profunctor \mathcal{K}* .

Modulo set-theoretic issues, every coupling can be obtained from the construction of Example 8.3.2.4:

0464 **Remark 8.3.2.5** (From Couplings to Profunctors). Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. By virtue of Corollary 5.7.0.6, the construction of Example 8.3.2.4 induces a monomorphism

$$\begin{array}{c} \{\text{Profunctors } \mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}\}/\text{Isomorphism} \\ \downarrow \\ \{\text{Couplings } \lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+\}/\text{Equivalence}, \end{array}$$

whose image consists of equivalence classes of couplings $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ having essentially small fibers.

In particular, to every coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ with essentially small fibers, we can associate a profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$, which is characterized (up to isomorphism) by the requirement that it is a covariant transport representation for λ (see Definition 5.7.5.1).

0465 **Variant 8.3.2.6.** Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories, and let κ be an uncountable cardinal. Then the construction of Example 8.3.2.4 induces a monomorphism

$$\begin{array}{c} \{\text{Profunctors } \mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}\}/\text{Isomorphism} \\ \downarrow \\ \{\text{Couplings } \lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+\}/\text{Equivalence}, \end{array}$$

whose image consists of equivalence classes of couplings $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ whose fibers are essentially κ -small.

Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. A profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ can be identified with a functor from $\mathcal{C}_-^{\text{op}}$ to the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{S})$. Our primary goal in this section is to formulate a condition which guarantees that this functor is fully faithful. First, it will be convenient to introduce some terminology.

Definition 8.3.2.7. Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor. Let X be an object of \mathcal{C}_- , let Y be an object of \mathcal{C}_+ , and let η be a vertex of the Kan complex $\mathcal{K}(X, Y)$. We will say that η is *universal* if it exhibits the functor $\mathcal{K}(-, Y) : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ as represented by the object $X \in \mathcal{C}_-$. We say that η is *couniversal* if it exhibits the functor $\mathcal{K}(X, -) : \mathcal{C}_+ \rightarrow \mathcal{S}$ as corepresented by the object $Y \in \mathcal{C}_+$.

Remark 8.3.2.8. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a covariant transport representation for λ . Let C be an object of \mathcal{C} and set $\lambda(C) = (X, Y)$. Then the isomorphism class of C (as an object of the fiber $\lambda^{-1}\{(X, Y)\}$) can be identified with a connected component $[\eta]$ of the Kan complex $\mathcal{K}(X, Y)$. Invoking Proposition 5.7.6.21, we deduce the following:

- The object $C \in \mathcal{C}$ is universal (in the sense of Definition 8.2.1.1) if and only if the vertex $\eta \in \mathcal{K}(X, Y)$ is universal (in the sense of Definition 8.3.2.7).
- The object $C \in \mathcal{C}$ is couniversal (in the sense of Definition 8.2.1.1) if and only if the vertex $\eta \in \mathcal{K}(X, Y)$ is couniversal (in the sense of Definition 8.3.2.7).

Definition 8.3.2.9. Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories, and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from \mathcal{C}_+ to \mathcal{C}_- . We say that \mathcal{K} is *representable* if, for each object $Y \in \mathcal{C}_+$, the functor $\mathcal{K}(-, Y) : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ is representable (in the sense of Variant 5.7.6.2). We will say that \mathcal{K} is *corepresentable* if, for each object $X \in \mathcal{C}_-$, the functor $\mathcal{K}(X, -) : \mathcal{C}_+ \rightarrow \mathcal{S}$ is corepresentable (in the sense of Definition 5.7.6.1).

Warning 8.3.2.10. The terminology of Definition 8.3.2.9 is potentially confusing. Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories, let \mathcal{C} denote the product $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$, and let $\mathcal{K} : \mathcal{C} \rightarrow \mathcal{S}$ be a morphism of simplicial sets. In general, there is no relationship between the corepresentability of \mathcal{K} as a \mathcal{S} -valued functor on \mathcal{C} (in the sense of Definition 5.7.6.1) and the corepresentability of \mathcal{K} as a *profunctor* from \mathcal{C}_+ to \mathcal{C}_- (in the sense of Definition 8.3.2.9). However, these notions of corepresentability coincide when \mathcal{C}_- is a contractible Kan complex (see Example 8.3.2.13).

Remark 8.3.2.11 (Symmetry). Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from \mathcal{C}_+ to \mathcal{C}_- . Then \mathcal{K} is representable if and only if it is corepresentable when regarded as a profunctor from $\mathcal{C}_-^{\text{op}}$ to $\mathcal{C}_+^{\text{op}}$ (see Remark 8.3.2.3).

03MH **Remark 8.3.2.12.** Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let \mathcal{K} and \mathcal{K}' be profunctors from \mathcal{C}_+ to \mathcal{C}_- which are isomorphic (as objects of the ∞ -category $\text{Fun}(\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \mathcal{S})$). Then \mathcal{K} is representable if and only if \mathcal{K}' is representable. Similarly, \mathcal{K} is corepresentable if and only if \mathcal{K}' is corepresentable. See Remark 5.7.6.4.

03MJ **Example 8.3.2.13.** Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor. If $\mathcal{C}_- = \Delta^0$, then the profunctor \mathcal{K} is corepresentable (in the sense of Definition 8.3.2.9) if and only if it is corepresentable when regarded as a functor $\mathcal{C}_+ \rightarrow \mathcal{S}$ (in the sense of Definition 5.7.6.1). Similarly, if $\mathcal{C}_+ = \Delta^0$, then the profunctor \mathcal{K} is representable (in the sense of Definition 8.3.2.9) if and only if it is representable when viewed as a functor $\mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ (in the sense of Variant 5.7.6.2).

03MK **Exercise 8.3.2.14.** Let \mathcal{C}_- and \mathcal{C}_+ be ordinary categories. Show that a profunctor

$$\mathcal{K} : N_{\bullet}(\mathcal{C}_-)^{\text{op}} \times N_{\bullet}(\mathcal{C}_+) \rightarrow \mathcal{S}$$

is representable (in the sense of Definition 8.3.2.9) if and only if it is isomorphic to the profunctor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}_-}(X, G(Y))$, for some functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. See Proposition 8.3.4.1 for a more general result.

0468 **Remark 8.3.2.15.** Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor. Then \mathcal{K} is representable if and only if, for every object $Y \in \mathcal{C}_+$, there exists an object $X \in \mathcal{C}_-$ and a universal vertex $\eta \in \mathcal{K}(X, Y)$. Similarly, \mathcal{K} is corepresentable if and only if, for every object $X \in \mathcal{C}_-$, there exists an object $Y \in \mathcal{C}_+$ and a couniversal vertex $\eta \in \mathcal{K}(X, Y)$.

0469 **Remark 8.3.2.16.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a covariant transport representation for λ . Using Remark 8.3.2.8, we deduce the following:

- The coupling λ is representable (in the sense of Definition 8.2.1.3) if and only if the profunctor \mathcal{K} is representable (in the sense of Definition 8.3.2.9).
- The coupling λ is corepresentable (in the sense of Definition 8.2.1.3) if and only if the profunctor \mathcal{K} is corepresentable (in the sense of Definition 8.3.2.9).

The main result of this section is the following variant of Proposition 8.2.6.8:

03ML **Proposition 8.3.2.17.** Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories, and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a corepresentable profunctor from \mathcal{C}_+ to \mathcal{C}_- . The following conditions are equivalent:

- (1) The profunctor \mathcal{K} determines a fully faithful functor

$$\mathcal{C}_-^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}) \quad X \mapsto \mathcal{K}(X, -).$$

(2) Let X be an object of \mathcal{C}_- and let Y be an object of \mathcal{C}_+ . Then every couniversal vertex $\eta \in \mathcal{K}(X, Y)$ is also universal.

Proof. Choose an object $X \in \mathcal{C}_-$. Since the functor $\mathcal{K}(X, -) : \mathcal{C}_+ \rightarrow \mathcal{S}$ is corepresentable, we can choose an object $Y \in \mathcal{C}_+$ and a couniversal vertex $\eta \in \mathcal{K}(X, Y)$. We will show that the following conditions are equivalent:

(1_X) For every object $X' \in \mathcal{C}_-$, the profunctor \mathcal{K} induces a homotopy equivalence

$$\mathrm{Hom}_{\mathcal{C}_-^{\mathrm{op}}}(X, X') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{S})}(\mathcal{K}(X, -), \mathcal{K}(X', -)).$$

(2_X) The vertex η is universal.

Proposition 8.3.2.17 will then follow by allowing the triple (X, Y, η) to vary.

Condition (2_X) is the assertion that, for each object $X' \in \mathcal{C}_-$, the composite map

$$\begin{aligned} \mathrm{Hom}_{\mathcal{C}_-^{\mathrm{op}}}(X, X') &\rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{S})}(\mathcal{K}(X, -), \mathcal{K}(X', -)) \\ &\rightarrow \mathrm{Hom}_{\mathcal{S}}(\mathcal{K}(X, Y), \mathcal{K}(X', Y)) \\ &\xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{K}(X', Y)) \\ &\simeq \mathcal{K}(X', Y) \end{aligned}$$

is an isomorphism in the homotopy category hKan. The equivalence of this assertion with (1_X) follows immediately from Proposition 8.3.1.3. \square

Definition 8.3.2.18 (Balanced Profunctors). Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. We say that a profunctor $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ is *balanced* if it satisfies the following conditions:

- The profunctor \mathcal{K} is representable and corepresentable (Definition 8.3.2.9).
- Let X be an object of \mathcal{C}_- , let Y be an object of \mathcal{C}_+ , and let η be a vertex of the Kan complex $\mathcal{K}(X, Y)$. Then η is universal if and only if it is couniversal.

In other words, $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ is balanced if it satisfies the hypotheses of Proposition 8.3.2.17 both when regarded as a profunctor from \mathcal{C}_+ to \mathcal{C}_- and when regarded as a profunctor from $\mathcal{C}_-^{\mathrm{op}}$ to $\mathcal{C}_+^{\mathrm{op}}$.

Remark 8.3.2.19. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a covariant transport representation for λ . Then the coupling λ is balanced (in the sense of Definition 8.2.6.1) if and only if the profunctor \mathcal{K} is balanced (in the sense of Definition 8.3.2.18). See Remark 8.3.2.8.

Corollary 8.3.2.20. Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from \mathcal{C}_- to \mathcal{C}_+ . The following conditions are equivalent:

- (1) *The profunctor \mathcal{K} is balanced (in the sense of Definition 8.3.2.18).*
- (2) *The ∞ -category \mathcal{C}_+ is locally small and \mathcal{K} induces a fully faithful functor*

$$\mathcal{C}_+^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}) \quad X \mapsto \mathcal{K}(X, -),$$

whose essential image is spanned by the corepresentable functors $\mathcal{C}_+ \rightarrow \mathcal{S}$.

- (3) *The ∞ -category \mathcal{C}_- is locally small and \mathcal{K} induces a fully faithful functor*

$$\mathcal{C}_+ \rightarrow \text{Fun}(\mathcal{C}_-^{\text{op}}, \mathcal{S}) \quad Y \mapsto \mathcal{K}(-, Y),$$

whose essential image is spanned by the representable functors $\mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$.

Proof. We will prove the equivalence of (1) and (2); the equivalence of (1) and (3) follows by a similar argument. Assume first that $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ is a balanced profunctor. Invoking Proposition 8.3.2.17, we see that the functor

$$\Phi : \mathcal{C}_-^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}) \quad X \mapsto \mathcal{K}(X, -)$$

is fully faithful, and that the essential image of Φ consists of corepresentable functors from \mathcal{C}_+ to \mathcal{S} . Fix an object $Y \in \mathcal{C}_+$. Since \mathcal{K} is representable, there exists an object $X \in \mathcal{C}_-$ and a universal vertex $\eta \in \mathcal{K}(X, Y)$. Our assumption that \mathcal{K} is balanced guarantees that η is also couniversal. In particular, for every object $Y' \in \mathcal{C}_+$, η induces a homotopy equivalence $\text{Hom}_{\mathcal{C}_+}(Y, Y') \xrightarrow{\sim} \mathcal{K}(X, Y')$, so that the Kan complex $\text{Hom}_{\mathcal{C}_+}(X, Y')$ is essentially small. If $F : \mathcal{C}_+ \rightarrow \mathcal{S}$ is any functor corepresented by Y , then Theorem 5.7.6.13 guarantees that F is isomorphic to $\mathcal{K}(X, -)$ (as an object of the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{S})$), and therefore belongs to the essential image of Φ . Allowing the object Y to vary, we deduce that the profunctor \mathcal{K} satisfies condition (2).

We now prove the converse. Assume that the functor Φ is fully faithful and that the essential image of Φ is spanned by the corepresentable functors $\mathcal{C}_+ \rightarrow \mathcal{S}$. We wish to show that the profunctor \mathcal{K} is balanced. Since Φ takes values in the full subcategory of $\text{Fun}(\mathcal{C}_+, \mathcal{S})$ spanned by the corepresentable functors, the profunctor \mathcal{K} is corepresentable. We next show that \mathcal{K} is representable. Fix an object $Y \in \mathcal{C}_+$; we wish to show that the functor $\mathcal{K}(-, Y) : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ is representable. Since \mathcal{C}_- is locally small, there exists a functor $F : \mathcal{C}_- \rightarrow \mathcal{S}$ which is corepresentable by Y (Theorem 5.7.6.13). Then F belongs to the essential image of Φ . We may therefore assume without loss of generality that $F = \mathcal{K}(X_0, -)$ for some object $X_0 \in \mathcal{C}_-$. Choose a couniversal vertex $\eta_0 \in \mathcal{K}(X_0, Y) = F(Y)$. Since Φ is fully faithful, Proposition 8.3.2.17 implies that η_0 is also universal, so that $\mathcal{K}(-, Y)$ is representable by X_0 .

To complete the proof, we must show that the pairing \mathcal{K} satisfies the second condition of Definition 8.3.2.18. Let $Y \in \mathcal{C}_+$ be as above, let X be any object of \mathcal{C}_- , and let η be a

vertex of the Kan complex $\mathcal{K}(X, Y)$. Assume that η is universal; we wish to show that it is also couniversal (the reverse implication follows from Proposition 8.3.2.17). Choose $\eta_0 \in \mathcal{K}(X_0, Y)$ as above. Since η_0 is universal, there exists an isomorphism $u : X \rightarrow X_0$ in the ∞ -category \mathcal{C}_- such that $\mathcal{K}(u, \text{id}_Y)(\eta_0)$ and η belong to the same connected component of the Kan complex $\mathcal{K}(X, Y)$ (Remark 5.7.6.6). We may therefore assume without loss of generality that $\eta = \mathcal{K}(u, \text{id}_Y)(\eta_0)$ (Remark 5.7.6.3). The desired result now follows by applying Remark 5.7.6.4 to the isomorphism of functors $\mathcal{K}(u, -) : \mathcal{K}(X_0, -) \rightarrow \mathcal{K}(X, -)$. \square

Corollary 8.3.2.21. *Let \mathcal{C} be a locally small ∞ -category, and let $\text{Fun}^{\text{corep}}(\mathcal{C}, \mathcal{S})$ denote the 03MP full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{S})$ spanned by the corepresentable functors. Then the evaluation map*

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{C}, \mathcal{S}) \times \mathcal{C} \rightarrow \mathcal{S} \quad (F, C) \mapsto F(C)$$

is a balanced profunctor.

Remark 8.3.2.22. Up to equivalence, every balanced profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ can 03MQ be obtained from the construction of Corollary 8.3.2.21. More precisely, let $\text{Fun}^{\text{corep}}(\mathcal{C}_+, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}_+, \mathcal{S})$ spanned by the corepresentable functors. If \mathcal{K} is balanced, then it factors as a composition

$$\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \xrightarrow{\Phi \times \text{id}} \text{Fun}^{\text{corep}}(\mathcal{C}_+, \mathcal{S}) \times \mathcal{C}_+ \xrightarrow{\text{ev}} \mathcal{S},$$

where Φ is an equivalence of ∞ -categories by virtue of Corollary 8.3.2.20.

8.3.3 Hom-Functors for ∞ -Categories

Let \mathcal{C} be an ∞ -category. In §4.6.1, we associated to every pair of objects $X, Y \in \mathcal{C}$ a 03MR Kan complex $\text{Hom}_{\mathcal{C}}(X, Y)$ parametrizing morphisms from X to Y . In this section, we will promote the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ to a functor of ∞ -categories.

Definition 8.3.3.1. Let \mathcal{C} be an ∞ -category. A *Hom-functor for \mathcal{C}* is a profunctor 046B

$$\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$$

which is a covariant transport representation for twisted arrow coupling $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$.

Proposition 8.3.3.2 (Existence and Uniqueness). *Let \mathcal{C} be an ∞ -category. Then \mathcal{C} admits 03N2 a Hom-functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ if and only if it is locally small. If this condition is satisfied, then \mathcal{H} is uniquely determined up to isomorphism.*

Proof. Combine Remark 8.3.5.3 with Corollary 5.7.0.6 (applied to the left fibration $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$). \square

03MX Remark 8.3.3.3. Let \mathcal{C} be an ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a Hom-functor for \mathcal{C} . Passing to homotopy categories, we obtain a functor $H : \text{h}\mathcal{C}^{\text{op}} \times \text{h}\mathcal{C} \rightarrow \text{hKan}$. It follows from Corollary 8.1.2.18 (and Remark 5.7.5.8) that H is isomorphic to the functor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ determined by the hKan enrichment of the homotopy category $\text{h}\mathcal{C}$ (see Construction 4.6.8.13). See Remark 8.3.5.4 for a more precise statement.

03MW Example 8.3.3.4. Let \mathcal{C} be a category. The construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ determines a functor

$$\mathcal{H} : \text{N}_\bullet(\mathcal{C})^{\text{op}} \times \text{N}_\bullet(\mathcal{C}) \rightarrow \text{N}_\bullet(\text{Set}) \subset \mathcal{S} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y),$$

which is a Hom-functor for the ∞ -category $\text{N}_\bullet(\mathcal{C})$. For a more general statement, see Proposition 8.3.6.2.

03V2 Variant 8.3.3.5. Let κ be an uncountable cardinal and let $\mathcal{S}^{<\kappa}$ denote the ∞ -category of κ -small spaces (Variant 5.6.4.12). Then an ∞ -category \mathcal{C} admits a Hom-functor

$$\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$$

if and only if it is locally κ -small. If this condition is satisfied, then \mathcal{H} is uniquely determined up to isomorphism.

03MY Remark 8.3.3.6 (Duality). Let \mathcal{C} be an ∞ -category, let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let $\mathcal{H}' : \mathcal{C} \times \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ be the functor obtained from \mathcal{H} by transposing its arguments. If \mathcal{H} is a Hom-functor for \mathcal{C} , then \mathcal{H}' is a Hom-functor for the opposite ∞ -category \mathcal{C}^{op} .

03N4 Notation 8.3.3.7. Let \mathcal{C} be a locally small ∞ -category. We will often use the notation $\text{Hom}_{\mathcal{C}}(-, -)$ to denote a Hom-functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$. Beware that this convention introduces a slight potential for confusion. Given a pair of objects $X, Y \in \mathcal{C}$, we have two potentially different definitions of $\text{Hom}_{\mathcal{C}}(X, Y)$:

- (a) The Kan complex $\{X\} \tilde{\times}_{\mathcal{C}} \{Y\}$ of Construction 4.6.1.1, which is well-defined up to canonical isomorphism.
- (b) The Kan complex $\mathcal{H}(X, Y)$, which is only well-defined up to homotopy equivalence (since it depends on a choice of Hom-functor \mathcal{H}).

However, the danger is slight: Remark 8.3.3.3 guarantees the existence of homotopy equivalences $\{X\} \tilde{\times}_{\mathcal{C}} \{Y\} \simeq \mathcal{H}(X, Y)$, which can be chosen to depend functorially on X and Y (as morphisms in the homotopy category hKan). Consequently, we can always modify the choice of Hom-functor \mathcal{H} to arrange that definitions (a) and (b) coincide (see Corollary 4.4.5.3).

Proposition 8.3.3.8. *Let \mathcal{C} be an ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a Hom-functor 046C for \mathcal{C} . Then \mathcal{H} is a balanced profunctor (see Definition 8.3.2.18).*

Proof. By virtue of Remark 8.3.2.19, it suffices to observe that the twisted arrow coupling $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ is balanced; see Example 8.2.6.2. \square

Definition 8.3.3.9. Let \mathcal{C} be an ∞ -category and let

03NF

$$h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad Y \mapsto h_Y$$

be a functor. We say that h_{\bullet} is a *covariant Yoneda embedding for \mathcal{C}* if the construction $(X, Y) \mapsto h_Y(X)$ is a Hom-functor for \mathcal{C} , in the sense of Definition 8.3.3.1. Similarly, we say that a functor

$$h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}) \quad X \mapsto h^X$$

is a *contravariant Yoneda embedding for \mathcal{C}* if the construction $(X, Y) \mapsto h^X(Y)$ is a Hom-functor for \mathcal{C} .

Remark 8.3.3.10 (Duality). A functor $h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S})$ is a contravariant Yoneda embedding for \mathcal{C} if and only if it is a covariant Yoneda embedding for the opposite ∞ -category \mathcal{C}^{op} ; see Remark 8.3.3.6.

Remark 8.3.3.11. Let \mathcal{C} be an ∞ -category. By virtue of Proposition 8.3.3.2, the following 03NH conditions are equivalent:

- The ∞ -category \mathcal{C} is locally small.
- The ∞ -category \mathcal{C} admits a covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.
- The ∞ -category \mathcal{C} admits a contravariant Yoneda embedding $h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S})$.

If these conditions are satisfied, then the functors h_{\bullet} and h^{\bullet} are uniquely determined up to isomorphism. Moreover, for every object $X \in \mathcal{C}$, the functor $h_X : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ is representable by X , and the functor $h^X : \mathcal{C} \rightarrow \mathcal{S}$ is corepresentable by X (Proposition 8.3.5.5).

Variant 8.3.3.12. Let κ be an uncountable cardinal and let $\mathcal{S}^{<\kappa}$ denote the ∞ -category of 03V4 κ -small spaces (see Variant 5.6.4.12). For every ∞ -category \mathcal{C} , the following conditions are equivalent:

- The ∞ -category \mathcal{C} is locally κ -small.
- The ∞ -category \mathcal{C} admits a covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$.
- The ∞ -category \mathcal{C} admits a contravariant Yoneda embedding $h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}^{<\kappa})$.

See Variant 8.3.5.7.

03NJ **Theorem 8.3.3.13** (Yoneda's Lemma for ∞ -Categories). *Let \mathcal{C} be a locally small ∞ -category. Then the covariant and contravariant Yoneda embeddings*

$$h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S})$$

are fully faithful functors, whose essential images are the full subcategories

$$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad \text{Fun}^{\text{corep}}(\mathcal{C}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}, \mathcal{S})$$

spanned by the representable and corepresentable functors, respectively.

Proof. By virtue of Corollary 8.3.2.20, this is a reformulation of Proposition 8.3.3.8. \square

We close this section by recording a simple observation about the Yoneda embedding.

03NP **Proposition 8.3.3.14.** *Let \mathcal{C} be a locally small ∞ -category and let $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ be a covariant Yoneda embedding for \mathcal{C} . Suppose we are given a diagram $\bar{f} : K^{\triangleleft} \rightarrow \mathcal{C}$, where K is a small simplicial set. The following conditions are equivalent:*

- (1) *The morphism \bar{f} is a limit diagram in \mathcal{C} .*
- (2) *The composition $h_{\bullet} \circ \bar{f}$ is a limit diagram in the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.*

Following the convention of Remark 5.4.0.5, we can regard Proposition 8.3.3.14 as a special case of the following more precise assertion (applied in the special case where $\kappa = \lambda$ is a strongly inaccessible cardinal):

03V5 **Variant 8.3.3.15.** Let λ be an uncountable cardinal, let \mathcal{C} be a locally λ -small ∞ -category, and let $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$ be a covariant Yoneda embedding for \mathcal{C} . Let $\kappa = \text{ecf}(\lambda)$ be the exponential cofinality of λ , let K be a κ -small simplicial set, and let $\bar{f} : K^{\triangleleft} \rightarrow \mathcal{C}$ be a diagram. Then the following conditions are equivalent:

- (1) *The morphism \bar{f} is a limit diagram in \mathcal{C} .*
- (2) *The composition $h_{\bullet} \circ \bar{f}$ is a limit diagram in the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$.*

Proof. Since K is κ -small, the ∞ -category $\mathcal{S}^{<\lambda}$ admits K -indexed limits (Example 7.6.7.4). For each object $X \in \mathcal{C}$, let $\text{ev}_X : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda}) \rightarrow \mathcal{S}^{<\lambda}$ denote the functor given by evaluation at X . By virtue of Proposition 7.1.6.1, condition (2) is equivalent to the requirement that for each object $X \in \mathcal{C}$, the composition

$$K^{\triangleleft} \xrightarrow{\bar{f}} \mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{\text{ev}_X} \mathcal{S}^{<\lambda}$$

is a limit diagram in the ∞ -category $\mathcal{S}^{<\lambda}$. Since the composite functor $(\text{ev}_X \circ h_{\bullet}) : \mathcal{C} \rightarrow \mathcal{S}^{<\lambda}$ is corepresentable by X , the equivalence (1) \Leftrightarrow (2) follows from Proposition 7.4.5.13 (and Remark 7.4.5.15). \square

Remark 8.3.3.16. In the situation of Variant 8.3.3.15, suppose that the ∞ -category \mathcal{C} admits 03V6 K -indexed limits. Then the ∞ -category of representable functors $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$ also admits K -indexed limits, which are preserved by the inclusion functor $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda}) \hookrightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$.

Corollary 8.3.3.17. *Let \mathcal{C} be an ∞ -category and let κ be an infinite cardinal. Then there 03Y7 exists a fully faithful functor $F : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, where $\widehat{\mathcal{C}}$ is κ -complete and κ -cocomplete. Moreover, we can arrange that F preserves the limits of all κ -small diagrams which exist in \mathcal{C} .*

Proof. Using Remark 5.4.3.19, we can choose an uncountable cardinal λ of exponential cofinality $\geq \kappa$. Enlarging λ if necessary, we may assume that \mathcal{C} is locally λ -small. Let $\widehat{\mathcal{C}}$ denote the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$ and let $F = h_{\bullet}$ be a covariant Yoneda embedding for \mathcal{C} . Since $\mathcal{S}^{<\lambda}$ is κ -complete and κ -cocomplete (Remark 7.4.5.7 and Variant 7.4.5.8), the ∞ -category $\widehat{\mathcal{C}}$ has the same property (Remark 7.6.7.5). Moreover, the functor F is fully faithful (Theorem 8.3.3.13) and preserves limits of κ -small diagrams (Remark 8.3.3.16). \square

8.3.4 Representable Profunctors

Let \mathcal{C} and \mathcal{D} be categories. There is a fully faithful embedding from the category of 03NQ functors $\text{Fun}(\mathcal{D}, \mathcal{C})$ to the category of profunctors $\text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \text{Set})$, which assigns to each functor $G : \mathcal{D} \rightarrow \mathcal{C}$ the representable profunctor

$$\mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \text{Set} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, G(Y)).$$

This construction has an ∞ -categorical counterpart:

Proposition 8.3.4.1 (Classification of Representable Profunctors). *Let \mathcal{C} and \mathcal{D} be ∞ -categories. Let κ be an uncountable cardinal for which \mathcal{C} is locally κ -small, and let*

$$\text{Hom}_{\mathcal{C}}(-, -) : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$$

be a Hom-functor for \mathcal{C} (see Notation 8.3.3.7). Then the construction $G \mapsto \text{Hom}_{\mathcal{C}}(-, G(-))$ determines a fully faithful functor

$$\text{Fun}(\mathcal{D}, \mathcal{C}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa}),$$

whose essential image is spanned by the representable profunctors from \mathcal{D} to \mathcal{C} .

Proof. Let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ spanned by the representable functors. By virtue of Theorem 8.3.3.13, the construction $Y \mapsto \text{Hom}_{\mathcal{C}}(-, Y)$ determines an equivalence of ∞ -categories $h^{\bullet} : \mathcal{C} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$. It follows that postcomposition with h^{\bullet} induces an equivalence of ∞ -categories

$$\text{Fun}(\mathcal{D}, \mathcal{C}) \rightarrow \text{Fun}(\mathcal{D}, \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})),$$

which is a restatement of Proposition 8.3.4.1. \square

03NS **Definition 8.3.4.2.** Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. Assume that \mathcal{C} is locally κ -small and let $\text{Hom}_{\mathcal{C}}(-, -) : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ be a Hom-functor for \mathcal{C} . We say that a profunctor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ is *representable by* G if it isomorphic to the composition

$$\mathcal{C}^{\text{op}} \times \mathcal{D} \xrightarrow{\text{id} \times G} \mathcal{C}^{\text{op}} \times \mathcal{C} \xrightarrow{\text{Hom}_{\mathcal{C}}(-, -)} \mathcal{S} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, G(Y))$$

as an object of the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa})$. By virtue of Proposition 8.3.3.2, this condition does not depend on the choice of Hom-functor $\text{Hom}_{\mathcal{C}}(-, -)$.

03NT **Example 8.3.4.3.** Let \mathcal{C} be a locally κ -small ∞ -category, and let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$ be a functor. Then \mathcal{F} is representable by an object $X \in \mathcal{C}$ (in the sense of Variant 5.7.6.2) if and only if, when regarded as a profunctor from Δ^0 to \mathcal{C} , it is representable by the functor $\Delta^0 \rightarrow \{X\} \hookrightarrow \mathcal{C}$ (in the sense of Definition 8.3.4.2).

Interchanging the roles of \mathcal{C} and \mathcal{D} , we obtain the following dual notion:

03NU **Variant 8.3.4.4.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that \mathcal{D} is locally κ -small and let $\text{Hom}_{\mathcal{D}}(-, -) : \mathcal{D}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}^{<\kappa}$ be a Hom-functor for \mathcal{D} . We say that a profunctor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ is *corepresentable by* F if it isomorphic to the composition

$$\mathcal{C}^{\text{op}} \times \mathcal{D} \xrightarrow{F^{\text{op}} \times \text{id}} \mathcal{D}^{\text{op}} \times \mathcal{D} \xrightarrow{\text{Hom}_{\mathcal{D}}(-, -)} \mathcal{S} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{D}}(F(X), Y)$$

as an object of the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa})$. By virtue of Proposition 8.3.3.2, this condition does not depend on the choice of Hom-functor $\text{Hom}_{\mathcal{D}}(-, -)$.

03NV **Example 8.3.4.5.** Let \mathcal{C} be a locally κ -small ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ be a profunctor from \mathcal{C} to itself. The following conditions are equivalent:

- The profunctor \mathcal{H} is a Hom-functor for \mathcal{C} .
- The profunctor \mathcal{H} is representable by the identity functor $\text{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$ (Definition 8.3.4.2).
- The profunctor \mathcal{H} is corepresentable by the identity functor $\text{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$ (Variant 8.3.4.4).

046D **Remark 8.3.4.6.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is essentially κ -small for some uncountable cardinal κ and let $\mathcal{H} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}$ be a covariant transport representation for λ . Then the profunctor \mathcal{H} is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ (in the sense of Definition 8.3.4.2) if and only if the coupling λ is representable by G (in the sense of Definition 8.2.3.1). Similarly, \mathcal{H} is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ if and only if λ is corepresentable by F .

Remark 8.3.4.7 (Uniqueness). Let κ be an uncountable cardinal and let $\mathcal{K} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}^{<\kappa}$ be a profunctor of ∞ -categories. If \mathcal{C} is locally κ -small small, then Proposition 8.3.4.1 guarantees that \mathcal{K} is representable (in the sense of Definition 8.3.2.9 if and only if it is representable by G , for some functor $G : \mathcal{D} \rightarrow \mathcal{C}$. Moreover, if this condition is satisfied, then the functor G is determined uniquely up to isomorphism. Similarly, if \mathcal{D} is locally κ -small small, then \mathcal{K} is corepresentable if and only if it is corepresentable by some functor $F : \mathcal{C} \rightarrow \mathcal{D}$. In this case, the functor F is also uniquely determined up to isomorphism.

Example 8.3.4.8. Let κ be an uncountable cardinal, let \mathcal{C}_- and \mathcal{C}_+ be locally κ -small small 046E ∞ -categories, and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}$ be a profunctor from \mathcal{C}_+ to \mathcal{C}_- . The following conditions are equivalent:

- The profunctor \mathcal{K} is balanced (Definition 8.3.2.18).
- The profunctor \mathcal{K} is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ which is an equivalence of ∞ -categories.
- The profunctor \mathcal{K} is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which is an equivalence of ∞ -categories.

By virtue of Theorem 8.3.3.13, this is a reformulation of Corollary 8.3.2.20.

Proposition 8.3.4.9 (Adjunctions as Profunctors). *Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories which represents a profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}$. Then a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ is left adjoint to G if and only if it corepresents the profunctor \mathcal{K} . In particular, \mathcal{K} is corepresentable if and only if the functor G admits a left adjoint.* 03PA

Proof. Choose a realization of \mathcal{K} as the covariant transport representation of a coupling of ∞ -categories $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ (see Remark 8.3.2.5). By virtue of Remark 8.3.4.6, the coupling λ is representable by the functor G . By virtue of Theorem 8.2.5.1, a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ is left adjoint to G if and only if it corepresents the coupling λ . Invoking Remark 8.3.4.6 again, we see that this is equivalent to the requirement that F corepresents the profunctor \mathcal{K} . □

Recall that, if \mathcal{C}_- and \mathcal{C}_+ are ∞ -categories, then we write $\text{LFun}(\mathcal{C}_-, \mathcal{C}_+)$ for the full subcategory of $\text{Fun}(\mathcal{C}_-, \mathcal{C}_+)$ spanned by those functors $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which are left adjoints (Notation 6.2.1.3). Similarly, we write $\text{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ for the full subcategory of $\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$ spanned by those functors $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ which are right adjoints.

Corollary 8.3.4.10. *Let \mathcal{C}_- and \mathcal{C}_+ be ∞ -categories. Let κ be an uncountable cardinal for 04B7 which \mathcal{C}_- and \mathcal{C}_+ are essentially κ -small, and let $\mathcal{E} \subseteq \text{Fun}(\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \mathcal{S}^{<\kappa})$ denote the full subcategory spanned by those profunctors $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}$ which are both representable and corepresentable. Then:*

- (1) *Composition with the covariant Yoneda embedding $\mathcal{C}_- \rightarrow \text{Fun}(\mathcal{C}_-^{\text{op}}, \mathcal{S}^{<\kappa})$ induces an equivalence of ∞ -categories $\rho : \text{R}\text{Fun}(\mathcal{C}_+, \mathcal{C}_-) \rightarrow \mathcal{E}$.*
- (2) *Composition with the contravariant Yoneda embedding $\mathcal{C}_+^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}^{<\kappa})$ induces an equivalence of ∞ -categories $\lambda : \text{L}\text{Fun}(\mathcal{C}_-, \mathcal{C}_+) \rightarrow \mathcal{E}^{\text{op}}$.*
- (3) *The composition $[\rho]^{-1} \circ [\lambda^{\text{op}}]$ determines a canonical isomorphism $\text{L}\text{Fun}(\mathcal{C}_-, \mathcal{C}_+)^{\text{op}} \simeq \text{R}\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$ in the homotopy category hQCat , which carries each functor $F \in \text{L}\text{Fun}(\mathcal{C}_-, \mathcal{C}_+)$ to a functor $G \in \text{R}\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$ which is right adjoint to F .*

Proof. Assertion (1) follows by combining Propositions 8.3.4.1 and 8.3.4.9, and assertion (2) follows by a similar argument. Assertion (3) follows by combining (1) and (2) with Proposition 8.3.4.9. \square

For many applications, Definition 8.3.4.2 is insufficiently precise. Given a functor of ∞ -categories $G : \mathcal{D} \rightarrow \mathcal{C}$, we would like to be able to consider not only profunctors which are *representable* by G (meaning that they are *abstractly* isomorphic to the profunctor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, G(Y))$) but profunctors which are *represented* by G (meaning that we have *chosen* an isomorphism with the profunctor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, G(Y))$, or some essentially equivalent datum). Here it is inconvenient that the functor $\text{Hom}_{\mathcal{C}}(-, -)$ is well-defined only up to isomorphism. To address this point, it is convenient to encode representability in a different way.

03MS **Notation 8.3.4.11.** Let \mathcal{S} denote the ∞ -category of spaces (Construction 5.6.1.1). We will regard the contractible Kan complex Δ^0 as an object of \mathcal{S} . For every ∞ -category \mathcal{E} , we let $\underline{\Delta}_{\mathcal{E}}^0$ denote the constant functor $\mathcal{E} \rightarrow \mathcal{S}$ taking the value Δ^0 .

03NX **Definition 8.3.4.12.** Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, let $\mathcal{K} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor from \mathcal{D} to \mathcal{C} , and let $\mathcal{K}|_{\text{Tw}(\mathcal{D})}$ denote the composite functor

$$\text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\text{op}} \times \mathcal{D} \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{C}^{\text{op}} \times \mathcal{D} \xrightarrow{\mathcal{K}} \mathcal{S}.$$

Suppose we are given a natural transformation $\beta : \underline{\Delta}_{\text{Tw}(\mathcal{D})}^0 \rightarrow \mathcal{K}|_{\text{Tw}(\mathcal{D})}$, where $\underline{\Delta}_{\text{Tw}(\mathcal{D})}^0$ denotes the constant functor $\text{Tw}(\mathcal{D}) \rightarrow \mathcal{S}$ taking the value Δ^0 . We say that β exhibits the profunctor \mathcal{K} as represented by G if, for every object $D \in \mathcal{D}$, the evaluation of β at the object $\text{id}_D \in \text{Tw}(\mathcal{D})$ determines a vertex $\beta(\text{id}_D) \in \mathcal{K}(G(D), D)$ which exhibits the functor $\mathcal{K}(-, D)$ as represented by the object $G(D) \in \mathcal{C}$ (see Variant 5.7.6.2).

046F **Remark 8.3.4.13.** In the situation of Definition 8.3.4.12, the natural transformation β can

be identified with a functor \tilde{G} which fits into a commutative diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{D}) & \xrightarrow{\tilde{G}} & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{D}) \\ \downarrow & & \downarrow \lambda \\ \mathcal{D}^{\mathrm{op}} \times \mathcal{D} & \xrightarrow{G^{\mathrm{op}} \times \mathrm{id}} & \mathcal{C}^{\mathrm{op}} \times \mathcal{D}. \end{array}$$

Moreover, the natural transformation β exhibits \mathcal{K} as represented by G (in the sense of Definition 8.3.4.12) if and only if \tilde{G} exhibits the coupling λ as represented by G (in the sense of Definition 8.2.4.1).

Example 8.3.4.14. In the situation of Definition 8.3.4.12, suppose that $\mathcal{D} = \Delta^0$. In this 03NY case, we can identify the profunctor \mathcal{K} with a functor $K : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$, we can identify the functor G with an object $X \in \mathcal{C}$, and we can identify β with a vertex of the Kan complex $K(X)$. Then β exhibits the profunctor \mathcal{K} as represented by the functor G (in the sense of Definition 8.3.4.12) if and only if it exhibits the functor K as represented by the object X (in the sense of Variant 5.7.6.2).

Proposition 8.3.4.15. *Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, where \mathcal{C} is locally 03P5 small, and let $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor. The following conditions are equivalent:*

- (1) *The profunctor $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ is representable by G , in the sense of Definition 8.3.4.2.*
- (2) *There exists a natural transformation $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{D})} \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{D})}$ which exhibits \mathcal{K} as represented by G , in the sense of Definition 8.3.4.12.*

Proof. By virtue of Remarks 8.3.4.6 and 8.3.4.13, this follows by applying Proposition 8.2.4.3 to the coupling

$$\{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{D}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{D}.$$

□

Variant 8.3.4.16 (Corepresentable Profunctors). Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor. We say that a natural transformation $\beta : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{C})}$ exhibits \mathcal{K} as corepresented by F if, for every object $X \in \mathcal{C}$, the image $\beta(\mathrm{id}_X) \in \mathcal{K}(X, F(X))$ exhibits the functor $\mathcal{K}(X, -) : \mathcal{D} \rightarrow \mathcal{S}$ as corepresented by the object $F(X) \in \mathcal{D}$, in the sense of Definition 5.7.6.1. Equivalently, β exhibits \mathcal{K} as corepresented by F if it exhibits \mathcal{K} as represented by the opposite functor F^{op} , when regarded as a profunctor from $\mathcal{C}^{\mathrm{op}}$ to $\mathcal{D}^{\mathrm{op}}$ (see Remark 8.3.2.3).

03P0 **Remark 8.3.4.17** (Homotopy Invariance). In the situation of Definition 8.3.4.12, the condition that β exhibits \mathcal{K} as corepresented by G depends only on the homotopy class $[\beta]$ (as a morphism in the homotopy category $\text{hFun}(\text{Tw}(\mathcal{D}), \mathcal{S})$) (see Remark 5.7.6.3).

03P1 **Remark 8.3.4.18** (Change of \mathcal{K}). Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. Suppose we are given a pair of profunctors $\mathcal{K}, \mathcal{K}' : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$, a natural transformation $\alpha : \mathcal{K} \rightarrow \mathcal{K}'$, and a commutative diagram

$$\begin{array}{ccc} & \Delta^0_{\text{Tw}(\mathcal{D})} & \\ \swarrow \beta & & \searrow \beta' \\ \mathcal{K}|_{\text{Tw}(\mathcal{D})} & \xrightarrow{\alpha|_{\text{Tw}(\mathcal{D})}} & \mathcal{K}'|_{\text{Tw}(\mathcal{D})} \end{array}$$

in the ∞ -category $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{S})$. Then any two of the following conditions imply the third:

- The natural transformation β exhibits the profunctor \mathcal{K} as represented by G .
- The natural transformation β' exhibits the profunctor \mathcal{K}' as represented by G .
- The natural transformation α is an isomorphism.

See Remark 5.7.6.4.

03P2 **Proposition 8.3.4.19.** Suppose we are given a functor of ∞ -categories $G : \mathcal{D} \rightarrow \mathcal{C}$, a profunctor $\mathcal{K} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$, and a natural transformation $\beta : \Delta^0_{\text{Tw}(\mathcal{D})} \rightarrow \mathcal{K}|_{\text{Tw}(\mathcal{D})}$. Then β exhibits \mathcal{K} as represented by G (in the sense of Definition 8.3.4.12) if and only if the induced map $\text{Tw}(\mathcal{D}) \rightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\text{op}} \times \mathcal{D})$ is left cofinal.

Proof. By virtue of Remark 8.3.4.13, this is a special case of Proposition 8.2.4.9. \square

03P3 **Proposition 8.3.4.20** (Representable Profunctors as Kan Extensions). Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, let $\mathcal{K} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor, and let $\beta : \Delta^0_{\text{Tw}(\mathcal{D})} \rightarrow \mathcal{K}|_{\text{Tw}(\mathcal{D})}$ be a natural transformation which exhibits \mathcal{K} as represented by G . Then β exhibits \mathcal{K} as a left Kan extension of the constant diagram $\Delta^0_{\text{Tw}(\mathcal{D})}$ along the composite map

$$\text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\text{op}} \times \mathcal{D} \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{C}^{\text{op}} \times \mathcal{D}.$$

Proof. Let \mathcal{E} denote the oriented fiber product $\{\Delta^0\} \tilde{\times}_{\mathcal{S}} (\mathcal{C}^{\text{op}} \times \mathcal{D})$ and let $\mu : \mathcal{E} \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{D}$ be the projection onto the second factor, so that we have a tautological natural transformation $\tilde{\beta} : \Delta^0_{\mathcal{E}} \rightarrow \mathcal{K} \circ \mu$. It follows from Proposition 7.6.2.16 that $\tilde{\beta}$ exhibits \mathcal{K} as a left Kan extension of $\Delta^0_{\mathcal{E}}$ along μ . The natural transformation β then determines a functor

$T : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{E}$ such that precomposition with T carries $\tilde{\beta}$ to β . By the transitivity of the formation of Kan extensions (Proposition 7.3.8.18), we are reduced to showing that the identity transformation $\text{id} : \underline{\Delta^0}_{\text{Tw}(\mathcal{D})} \rightarrow \underline{\Delta^0}_{\mathcal{E}} \circ T$ exhibits $\underline{\Delta^0}_{\mathcal{E}}$ as a left Kan extension of $\underline{\text{Tw}(\mathcal{D})}$ along T . This is a special case of Remark 7.6.2.12, since the functor T is left cofinal (Proposition 8.3.4.19). \square

Corollary 8.3.4.21 (The Universal Mapping Property of Representable Profunctors). *Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. Suppose we are given a pair of profunctors $\mathcal{H}, \mathcal{H}' : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$, and let $\beta : \underline{\Delta^0}_{\text{Tw}(\mathcal{D})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{D})}$ be a natural transformation which exhibits \mathcal{H} as represented by G . Then precomposition with β induces a homotopy equivalence of Kan complexes*

$$\text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \mathcal{S})}(\mathcal{H}, \mathcal{H}') \rightarrow \text{Hom}_{\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{S})}(\underline{\Delta^0}_{\text{Tw}(\mathcal{D})}, \mathcal{H}'|_{\text{Tw}(\mathcal{D})}).$$

Proof. Combine Propositions 8.3.4.20 and 7.3.6.1. \square

Example 8.3.4.22 (Spaces of Natural Transformation). Let $G, G' : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories and let \mathcal{H} be a Hom-functor for \mathcal{C} . Combining Corollary 8.3.4.21 with Proposition 8.3.4.1, we obtain homotopy equivalences of Kan complexes

$$\begin{aligned} \text{Hom}_{\text{Fun}(\mathcal{D}, \mathcal{C})}(G, G') &\simeq \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{D}, \mathcal{S})}(\mathcal{H} \circ (\text{id} \times G), \mathcal{H} \circ (\text{id} \times G')) \\ &\simeq \text{Hom}_{\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{S})}(\underline{\Delta^0}_{\text{Tw}(\mathcal{D})}, \mathcal{H}|_{\text{Tw}(\mathcal{D})}) \\ &\simeq \varprojlim(\mathcal{H}|_{\text{Tw}(\mathcal{D})}). \end{aligned}$$

Stated more informally, the space of natural transformations from G to G' can be viewed as a limit of the diagram

$$\text{Tw}(\mathcal{D}) \rightarrow \mathcal{S} \quad (f : X \rightarrow Y) \mapsto \text{Hom}_{\mathcal{C}}(G(X), G'(Y)).$$

Corollary 8.3.4.23. *Let \mathcal{C} be an ∞ -category and let W be a collection of morphisms in \mathcal{C} . Let K be a simplicial set, and let \widetilde{W} be the collection of morphisms in $\text{Fun}(K, \mathcal{C})$ consisting of those natural transformations $w : F \rightarrow F'$ with the property that, for each vertex $x \in K$, the image $w_x : F(x) \rightarrow F'(x)$ belongs to W . If $G : K \rightarrow \mathcal{C}$ is a diagram which carries each vertex of K to a W -local object of \mathcal{C} , then G is \widetilde{W} -local when viewed as an object of $\text{Fun}(K, \mathcal{C})$ (see Definition 6.3.3.1)*

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $K \hookrightarrow \mathcal{K}$, where \mathcal{K} is an ∞ -category. Extend G to a functor $\overline{G} : \mathcal{K} \rightarrow \mathcal{C}$. Since the restriction map $\text{Fun}(\mathcal{K}, \mathcal{C}) \rightarrow \text{Fun}(K, \mathcal{C})$ is a trivial Kan fibration (Proposition 1.4.7.6), we can replace K by \mathcal{K} (and G by \overline{G}) and thereby reduce to proving Corollary 8.3.4.23 in the special case where $K = \mathcal{K}$ is an ∞ -category.

Let $w : F \rightarrow F'$ be a morphism in $\text{Fun}(\mathcal{K}, \mathcal{C})$ which belongs to \widetilde{W} ; we wish to show that precomposition with w induces a homotopy equivalence of Kan complexes $\theta : \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{C})}(F', G) \xrightarrow{\circ[w]} \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{C})}(F, G)$. Let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a Hom-functor for \mathcal{C} , let $U : \text{Tw}(\mathcal{K}) \rightarrow \mathcal{S}$ be the functor given by the composition

$$\text{Tw}(\mathcal{K}) \rightarrow \mathcal{K}^{\text{op}} \times \mathcal{K} \xrightarrow{F^{\text{op}} \times G} \mathcal{C}^{\text{op}} \times \mathcal{C} \xrightarrow{\mathcal{H}} \mathcal{S}$$

and define $U' : \text{Tw}(\mathcal{K}) \rightarrow \mathcal{S}$ similarly. The morphism w induces a natural transformation $\overline{w} : U' \rightarrow U$, which carries each object $(f : X \rightarrow Y)$ of $\text{Tw}(\mathcal{K})$ to the morphism of Kan complexes

$$\overline{w}_f : U'(f) \simeq \text{Hom}_{\mathcal{C}}(F'(X), G(Y)) \rightarrow \text{Hom}_{\mathcal{C}}(F(X), G(Y)) \simeq U(f)$$

given by precomposition with the morphism $w_X : F'(X) \rightarrow F(X)$ of \mathcal{C} . Since w_X belongs to W and the object $G(Y) \in \mathcal{C}$ is W -local, it follows that \overline{w}_f is a homotopy equivalence. Applying Theorem 4.4.4.4, we see that \overline{w} is an isomorphism (in the functor ∞ -category $\text{Fun}(\text{Tw}(\mathcal{K}), \mathcal{S})$). We conclude by observing that Example 8.3.4.22 supplies an identification of θ with the image of \overline{w} under the limit functor $\varprojlim : \text{Fun}(\text{Tw}(\mathcal{K}), \mathcal{S}) \rightarrow \mathcal{S}$. \square

8.3.5 Recognition of Hom-Functors

046H Let \mathcal{C} be an ∞ -category. If \mathcal{C} is locally small, then Proposition 8.3.3.2 guarantees that it admits a Hom-functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$, which is uniquely determined up to isomorphism. Our goal in this section is to formulate a more precise statement, which characterizes the functor \mathcal{H} up to *canonical* isomorphism (see Proposition 8.3.5.6).

03MT **Definition 8.3.5.1.** Let \mathcal{C} be an ∞ -category, let $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ denote the left fibration of Proposition 8.1.1.11, and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor. We say that a natural transformation $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ exhibits \mathcal{H} as a Hom-functor for \mathcal{C} if it satisfies the following condition:

- (*) For every pair of objects $X, Y \in \mathcal{C}$, the natural transformation α induces a homotopy equivalence of Kan complexes

$$\alpha_{X,Y} : \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{H}(X, Y)).$$

03MZ **Remark 8.3.5.2.** Let \mathcal{C} be an ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor. The datum of a natural transformation $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ can be identified with a

commutative diagram of ∞ -categories

$$\begin{array}{ccc}
 \mathrm{Tw}(\mathcal{C}) & \longrightarrow & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \\
 \downarrow & & \downarrow \\
 \mathcal{C}^{\mathrm{op}} \times \mathcal{C} & \xrightarrow{\mathcal{H}} & \mathcal{S}.
 \end{array} \tag{8.47}$$
03NO

In this case, the natural transformation α exhibits \mathcal{H} as a Hom-functor for \mathcal{C} if and only if the diagram (8.47) is a categorical pullback square (see Corollary 5.1.7.15).

Remark 8.3.5.3. Let \mathcal{C} be an ∞ -category. A profunctor $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ is a Hom-functor 03N1 for \mathcal{C} (in the sense of Definition 8.3.3.1) if and only if there exists a natural transformation $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\mathrm{Tw}(\mathcal{C})}$ which exhibits \mathcal{H} as a Hom-functor for \mathcal{C} (in the sense of Definition 8.3.5.1).

Remark 8.3.5.4. Let \mathcal{C} be an ∞ -category, let $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor, and let 03MV $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\mathrm{Tw}(\mathcal{C})}$ be a natural transformation. For every pair of objects $X, Y \in \mathcal{C}$, Notation 8.1.2.14 and Remark 5.6.1.5 supply canonical isomorphisms

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \simeq \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \quad \mathcal{H}(X, Y) \simeq \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{H}(X, Y))$$

in the homotopy category hKan. Consequently, the homotopy class of the morphism $\alpha_{X,Y}$ appearing in Definition 8.3.5.1 can be identified with a map $[\alpha_{X,Y}] : \mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathcal{H}(X, Y)$ in hKan, which depends functorially on X and Y (see Corollary 8.1.2.18). The natural transformation α exhibits \mathcal{H} as a Hom-functor for \mathcal{C} (in the sense of Definition 8.3.5.1) if and only if each $[\alpha_{X,Y}]$ is an isomorphism in the category hKan.

Proposition 8.3.5.5. Let \mathcal{C} be an ∞ -category, let $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor, and let 03NK $\alpha : \underline{\Delta^0}_{\mathrm{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\mathrm{Tw}(\mathcal{C})}$ be a natural transformation. The following conditions are equivalent:

- (1) The natural transformation α exhibits \mathcal{H} as a Hom-functor for \mathcal{C} (in the sense of Definition 8.3.5.1).
- (2) The natural transformation α exhibits the profunctor \mathcal{H} as represented by the identity functor $\mathrm{id} : \mathcal{C} \rightarrow \mathcal{C}$ (in the sense of Definition 8.3.4.12). That is, for every object $X \in \mathcal{C}$, the vertex $\alpha(\mathrm{id}_X) \in \mathcal{H}(X, X)$ exhibits the functor $\mathcal{H}(-, X) : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$ as represented by the object X .
- (3) The natural transformation α exhibits the profunctor \mathcal{H} as corepresented by the identity functor $\mathrm{id} : \mathcal{C} \rightarrow \mathcal{C}$ (in the sense of Variant 8.3.4.16). That is, for every object $X \in \mathcal{C}$, the vertex $\alpha(\mathrm{id}_X) \in \mathcal{H}(X, X)$ exhibits the functor $\mathcal{H}(X, -) : \mathcal{C} \rightarrow \mathcal{S}$ as corepresented by the object X .

Proof. We will show that (1) \Leftrightarrow (3); the proof of the equivalence (1) \Leftrightarrow (2) is similar. The natural transformation α can be identified with a functor $T : \text{Tw}(\mathcal{C}) \rightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}$. For each object $X \in \mathcal{C}$, let T_X denote the restriction of B to the simplicial subset $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \subseteq \text{Tw}(\mathcal{C})$, and consider the following condition:

(1_X) The diagram of ∞ -categories

$$\begin{array}{ccc} \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T_X} & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \\ \downarrow & & \downarrow \\ \mathcal{C} & \xrightarrow{\mathcal{H}(X, -)} & \mathcal{S} \end{array} \quad (8.48)$$

is a categorical pullback square.

By virtue of Corollary 5.1.7.15, the natural transformation α exhibits \mathcal{H} as a Hom-functor for \mathcal{C} if and only if it satisfies condition (1_X) for every object $X \in \mathcal{C}$. To complete the proof, it will suffice to show that (1_X) is satisfied if and only if $\alpha(\text{id}_X) \in \mathcal{H}(X, X)$ exhibits the functor $\mathcal{H}(X, -)$ as corepresented by X . This is a special case of Proposition 5.7.6.21, since the id_X is an initial object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (Proposition 8.1.2.1). \square

03N3 **Proposition 8.3.5.6.** *Let \mathcal{C} be a locally small ∞ -category, let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let $\alpha : \underline{\Delta^0}_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ be a natural transformation. The following conditions are equivalent:*

- (1) *The natural transformation α exhibits \mathcal{H} as a Hom-functor for \mathcal{C} : that is, it satisfies condition (*) of Definition 8.3.5.1.*
- (2) *The diagram*

$$\begin{array}{ccc} & \mathcal{C}^{\text{op}} \times \mathcal{C} & \\ \lambda \swarrow & \uparrow \alpha & \searrow \mathcal{H} \\ \text{Tw}(\mathcal{C}) & \xrightarrow{\underline{\Delta^0}_{\text{Tw}(\mathcal{C})}} & \mathcal{S}. \end{array}$$

exhibits \mathcal{H} as a left Kan extension of the constant functor $\underline{\Delta^0}_{\text{Tw}(\mathcal{C})}$ along the left fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$.

- (3) *The pair (\mathcal{H}, α) is initial when viewed as an object of the oriented fiber product $\{\underline{\Delta^0}_{\text{Tw}(\mathcal{C})}\} \tilde{\times}_{\text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{S})} \text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{C}, \mathcal{S})$*

Proof. The equivalence (1) \Leftrightarrow (2) follows from Proposition 7.6.2.16 and Remark 8.3.5.2. Since \mathcal{C} is locally small, Proposition 8.3.3.2 guarantees that the functor $\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0$ admits a left Kan extension along λ , so the equivalence (2) \Leftrightarrow (3) follows from Corollary 7.3.6.5. \square

Variant 8.3.5.7. Let κ be an uncountable cardinal and let \mathcal{C} be an ∞ -category which is 03V3 locally κ -small. Then, in the statement of Proposition 8.3.5.6, we can replace \mathcal{S} with the ∞ -category $\mathcal{S}^{<\kappa}$ of κ -small spaces (Variant 5.6.4.12).

Corollary 8.3.5.8 (Functoriality of Hom-Functors). *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between 046J ∞ -categories. Choose natural transformations*

$$\alpha : \underline{\Delta}_{\text{Tw}(\mathcal{C})}^0 \rightarrow \mathcal{H}_{\mathcal{C}}|_{\text{Tw}(\mathcal{C})} \quad \beta : \underline{\Delta}_{\text{Tw}(\mathcal{D})}^0 \rightarrow \mathcal{H}_{\mathcal{D}}|_{\text{Tw}(\mathcal{D})}$$

which exhibit $\mathcal{H}_{\mathcal{C}}$ and $\mathcal{H}_{\mathcal{D}}$ as Hom-functors for \mathcal{C} and \mathcal{D} , respectively. Then there exists a natural transformation $\gamma : \mathcal{H}_{\mathcal{C}}(-, -) \rightarrow \mathcal{H}_{\mathcal{D}}(F(-), F(-))$ for which the diagram

$$\begin{array}{ccc} & \underline{\Delta}_{\text{Tw}(\mathcal{C})}^0 & \\ [\alpha] \swarrow & & \searrow [\beta] \\ \mathcal{H}_{\mathcal{C}}|_{\text{Tw}(\mathcal{C})} & \xrightarrow{[\gamma]} & \mathcal{H}_{\mathcal{D}}|_{\text{Tw}(\mathcal{C})} \end{array} \tag{8.49}$$

03PC

commutes (in the homotopy category $\text{hFun}(\text{Tw}(\mathcal{C}), \mathcal{S})$). Moreover, the natural transformation γ is uniquely determined up to homotopy.

Proof. This is a special case of Proposition 7.3.6.1, since α exhibits $\mathcal{H}_{\mathcal{C}}$ as a left Kan extension of $\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0$ along the left fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ (Proposition 8.3.5.6). \square

Remark 8.3.5.9. In the situation of Corollary 8.3.5.8, suppose that we are given a pair of 03PD objects $X, Y \in \mathcal{C}$. The commutativity of (8.49) guarantees that the diagram

$$\begin{array}{ccc} \text{Hom}_{\mathcal{C}}(X, Y) & \xrightarrow{F} & \text{Hom}_{\mathcal{D}}(F(X), F(Y)) \\ \downarrow \sim & & \downarrow \sim \\ \mathcal{H}_{\mathcal{C}}(X, Y) & \xrightarrow{\gamma} & \mathcal{H}_{\mathcal{D}}(F(X), F(Y)) \end{array}$$

commutes in the homotopy category hKan , where the vertical maps are the isomorphisms of Remark 8.3.5.4. We can summarize the situation more informally as follows: if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor between (locally small) ∞ -categories, then the induced map of Kan complexes $\text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{D}}(F(X), F(Y))$ depends functorially on the pair (X, Y) (as an object of the ∞ -category $\mathcal{C}^{\text{op}} \times \mathcal{C}$).

8.3.6 Strict Models for Hom-Functors

03N5 Let \mathcal{E} be a (locally small) ∞ -category. Proposition 8.3.3.2 guarantees the existence of a Hom-functor $\mathcal{H} : \mathcal{E}^{\text{op}} \times \mathcal{E} \rightarrow \mathcal{S}$, which is well-defined up to isomorphism. Our goal in this section is to give an explicit construction of a Hom-functor in the special case where $\mathcal{E} = N_{\bullet}^{\text{hc}}(\mathcal{C})$ arises as the homotopy coherent nerve of a (locally Kan) simplicial category \mathcal{C} .

03N6 **Construction 8.3.6.1.** Let \mathcal{C} be a locally Kan simplicial category. Then the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)_{\bullet}$ determines a simplicial functor $\mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \text{Kan}$. Passing to homotopy coherent nerves, we obtain a functor of ∞ -categories

$$\mathcal{H}_{\mathcal{C}} : N_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times N_{\bullet}^{\text{hc}}(\mathcal{C}) \rightarrow N_{\bullet}^{\text{hc}}(\text{Kan}) = \mathcal{S}.$$

03N7 **Proposition 8.3.6.2.** *Let \mathcal{C} be a locally Kan simplicial category. Then the functor $\mathcal{H}_{\mathcal{C}}$ of Construction 8.3.6.1 is a Hom-functor for the ∞ -category $N_{\bullet}^{\text{hc}}(\mathcal{C})$.*

03N8 **Remark 8.3.6.3.** Let \mathcal{C} be an ordinary category, which we identify with the corresponding constant simplicial category (see Example 2.4.2.4). In this case, Proposition 8.3.6.2 reduces to Example 8.3.3.4.

03N9 **Remark 8.3.6.4.** By combining Proposition 8.3.6.2 with the rectification results of §[?], we can give an explicit construction of a Hom-functor for an arbitrary (small) ∞ -category \mathcal{E} . Let $\text{Path}[\mathcal{E}]_{\bullet}$ denote the simplicial path category of \mathcal{E} (Definition 2.4.4.1) and let \mathcal{C} be the locally Kan simplicial having the same objects, with morphism spaces given by $\text{Hom}_{\mathcal{C}}(X, Y)_{\bullet} = \text{Ex}^{\infty}(\text{Hom}_{\text{Path}[\mathcal{E}]}(X, Y)_{\bullet})$ (see Example [?]). It follows from Proposition 3.3.6.7 that the tautological map $\text{Path}[\mathcal{E}]_{\bullet} \rightarrow \mathcal{C}$ is a weak equivalence of simplicial categories (in the sense of Definition 4.6.7.7), and therefore corresponds to an equivalence of ∞ -categories $F : \mathcal{E} \rightarrow N_{\bullet}^{\text{hc}}(\mathcal{C})$ (Theorem [?]). Using Proposition 8.3.6.2, we deduce that the composition

$$\mathcal{E}^{\text{op}} \times \mathcal{E} \xrightarrow{F^{\text{op}} \times F} N_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times N_{\bullet}^{\text{hc}}(\mathcal{C}) \xrightarrow{\mathcal{H}_{\mathcal{C}}} \mathcal{S}$$

is a Hom-functor for \mathcal{E} , given on objects by $(X, Y) \mapsto \text{Ex}^{\infty}(\text{Hom}_{\text{Path}[\mathcal{E}]}(X, Y))$.

Beware that, although this construction is completely explicit in principle, it is hard to use in practice (since the operations $\mathcal{E} \mapsto \text{Path}[\mathcal{E}]_{\bullet}$ and $S \mapsto \text{Ex}^{\infty}(S)$ are both difficult to control).

Proposition 8.3.6.2 asserts that the functor $\mathcal{H}_{\mathcal{C}}$ is a covariant transport representation for the left fibration $\text{Tw}(N_{\bullet}^{\text{hc}}(\mathcal{C})) \rightarrow N_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times N_{\bullet}^{\text{hc}}(\mathcal{C})$ (Remark 8.3.5.3). We will prove this

by constructing a categorical pullback square of ∞ -categories

$$\begin{array}{ccc} \mathrm{Tw}(N_\bullet^{\mathrm{hc}}(\mathcal{C})) & \xrightarrow{\widetilde{\mathcal{H}}_{\mathcal{C}}} & \mathcal{S}_* \\ \downarrow & & \downarrow U \\ N_\bullet^{\mathrm{hc}}(\mathcal{C})^{\mathrm{op}} \times N_\bullet^{\mathrm{hc}}(\mathcal{C}) & \xrightarrow{\mathcal{H}_{\mathcal{C}}} & \mathcal{S}. \end{array}$$

To define the upper horizontal map, we will use a variant of Construction 8.3.6.1.

Construction 8.3.6.5. Let \mathcal{C} be a locally Kan simplicial category, let $N_\bullet^{\mathrm{hc}}(\mathcal{C})$ denote its homotopy coherent nerve. Let J be a linearly ordered set and let \bar{J} denote its opposite; for each element $j \in J$, we write \bar{j} for the corresponding element of \bar{J} . Suppose we are given a morphism of simplicial sets $\sigma : N_\bullet(J) \rightarrow \mathrm{Tw}(N_\bullet^{\mathrm{hc}}(\mathcal{C}))$, which we identify with a simplicial functor $f : \mathrm{Path}[\bar{J} \star J]_\bullet \rightarrow \mathcal{C}$ (see Warning 8.1.1.9 and Proposition 2.4.4.15). Note that the composition

$$N_\bullet(J) \xrightarrow{\sigma} \mathrm{Tw}(N_\bullet^{\mathrm{hc}}(\mathcal{C})) \rightarrow N_\bullet^{\mathrm{hc}}(\mathcal{C})^{\mathrm{op}} \times N_\bullet^{\mathrm{hc}}(\mathcal{C}) \xrightarrow{\mathcal{H}_{\mathcal{C}}} \mathcal{S}$$

can be identified with a simplicial functor $F_\sigma : \mathrm{Path}[J]_\bullet \rightarrow \mathrm{Kan}$, given on objects by the formula $F_\sigma(j) = \mathrm{Hom}_{\mathcal{C}}(f(\bar{j}), f(j))_\bullet$ (see Proposition 2.4.4.15). Let $J^\triangleleft = \{x\} \star J$ denote the linearly ordered set obtained from J by adding a new smallest element x . We extend F_σ to a simplicial functor $\tilde{F}_\sigma : \mathrm{Path}[J^\triangleleft]_\bullet \rightarrow \mathrm{Kan}$ as follows:

- (a) The functor \tilde{F}_σ carries the element $x \in J^\triangleleft$ to the Kan complex Δ^0 .
- (b) Let j be an element of J . Let us identify $\mathrm{Hom}_{\mathrm{Path}[J^\triangleleft]}(x, j)_\bullet$ with the nerve $N_\bullet(Q)$, where Q is the collection of finite subsets $I \subseteq J$ satisfying $\max(I) = j$ (partially ordered by reverse inclusion). Similarly, we identify $\mathrm{Hom}_{\mathrm{Path}[\bar{J} \star J]}(\bar{j}, j)_\bullet$ with the nerve $N_\bullet(Q')$, where Q' is the collection of finite subsets $I' \subseteq \bar{J} \star J$ satisfying $\max(I') = j$ and $\min(I') = \bar{j}$ (partially ordered by reverse inclusion). Then \tilde{F}_σ is defined on the morphism space $\mathrm{Hom}_{\mathrm{Path}[J^\triangleleft]}(x, j)_\bullet$ by the composition

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Path}[J^\triangleleft]}(x, j)_\bullet &\xrightarrow{\simeq} N_\bullet(Q) \\ &\xrightarrow{I \mapsto \bar{I} \cup I} N_\bullet(Q') \\ &\simeq \mathrm{Hom}_{\mathrm{Path}[\bar{J} \star J]}(\bar{j}, j)_\bullet \\ &\xrightarrow{f} \mathrm{Hom}_{\mathcal{C}}(f(\bar{j}), f(j))_\bullet \\ &\simeq \mathrm{Fun}(\tilde{F}_\sigma(x), \tilde{F}_\sigma(j)). \end{aligned}$$

In the special case where J is the linearly ordered set $[n] = \{0 < 1 < \dots < n\}$, we can identify \tilde{F}_σ with an n -simplex of the ∞ -category of pointed spaces $\mathcal{S}_* = N_\bullet^{\mathrm{hc}}(\mathrm{Kan})_{\Delta^0}/$.

The assignment $\sigma \mapsto \tilde{F}_\sigma$ depends functorially on $[n]$, and therefore determines a functor $\widetilde{\mathcal{H}}_{\mathcal{C}} : \text{Tw}(N_\bullet^{\text{hc}}(\mathcal{C})) \rightarrow \mathcal{S}_*$. By construction, this functor fits into a commutative diagram

$$\begin{array}{ccc}
 \text{03NB} & \text{Tw}(N_\bullet^{\text{hc}}(\mathcal{C})) & \xrightarrow{\widetilde{\mathcal{H}}_{\mathcal{C}}} \mathcal{S}_* \\
 & \downarrow & \downarrow U \\
 & N_\bullet^{\text{hc}}(\mathcal{C})^{\text{op}} \times N_\bullet^{\text{hc}}(\mathcal{C}) & \xrightarrow{\mathcal{H}_{\mathcal{C}}} \mathcal{S},
 \end{array} \tag{8.50}$$

where the left vertical map is the twisted arrow fibration of Proposition 8.1.1.11 and the right vertical map is the forgetful functor.

03NC Exercise 8.3.6.6. Verify that Construction 8.3.6.5 is well-defined. That is, for every linearly ordered set J and every morphism $\sigma : N_\bullet(J) \rightarrow \text{Tw}(N_\bullet^{\text{hc}}(\mathcal{C}))$, show that the simplicial functor F_σ admits a unique extension $\tilde{F}_\sigma : \text{Path}[J^\triangleleft]_\bullet \rightarrow \text{Kan}$ which satisfies conditions (a) and (b).

Proposition 8.3.6.2 is an immediate consequence of the following more precise result:

03ND Proposition 8.3.6.7. *Let \mathcal{C} be a locally Kan simplicial category. Then the diagram (8.50) is a categorical pullback square.*

Proof. Note that the vertical maps in the diagram (8.50) are left fibrations (Propositions 8.1.1.11 and 5.6.3.2). It will therefore suffice to show that, for every pair of objects $X, Y \in \mathcal{C}$, the induced map of fibers

$$\begin{aligned}
 \widetilde{\mathcal{H}}_{X,Y} : \{X\} \times_{\mathcal{E}^{\text{op}}} \text{Tw}(\mathcal{E}) \times_{\mathcal{E}} \{Y\} &\rightarrow \{\mathcal{H}_{\mathcal{C}}(X, Y)\} \times_{\mathcal{S}} \mathcal{S}_* \\
 &= \text{Hom}_{\mathcal{S}}^L(\Delta^0, \text{Hom}_{\mathcal{C}}(X, Y)_\bullet)
 \end{aligned}$$

is a homotopy equivalence of Kan complexes (see Corollary 5.1.7.15). Note that the coslice inclusion of Construction 8.1.2.7 induces a monomorphism of simplicial sets $\iota : \text{Hom}_{\mathcal{E}}^L(X, Y) \hookrightarrow \{X\} \times_{\mathcal{E}^{\text{op}}} \text{Tw}(\mathcal{E}) \times_{\mathcal{E}} \{Y\}$. Unwinding the definitions, we see that the composite map

$$(\widetilde{\mathcal{H}}_{X,Y} \circ \iota) : \text{Hom}_{\mathcal{E}}^L(X, Y) \rightarrow \text{Hom}_{\mathcal{S}}^L(\Delta^0, \text{Hom}_{\mathcal{C}}(X, Y)_\bullet)$$

coincides with isomorphism described in Remark 4.6.7.18. It will therefore suffice to show that ι is a homotopy equivalence, which is a special case of Corollary 8.1.2.10. \square

8.4 Cocompletion

Let \mathcal{C} be a small ∞ -category. It is very rare for \mathcal{C} to admit small colimits: this is possible only if \mathcal{C} is (equivalent to the nerve of) a partially ordered set (Proposition 7.6.2.15). However, it is always possible to *embed* \mathcal{C} into a larger ∞ -category which admits small colimits. Our goal in this section is to study the universal example of such an enlargement.

Definition 8.4.0.1. Let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories. We will say that h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of \mathcal{C} if the following conditions are satisfied:

- (1) The ∞ -category $\widehat{\mathcal{C}}$ admits small colimits.
- (2) Let \mathcal{D} be an ∞ -category which admits small colimits and let $\text{Fun}'(\widehat{\mathcal{C}}, \mathcal{D})$ denote the full subcategory of $\text{Fun}(\widehat{\mathcal{C}}, \mathcal{D})$ spanned by those functors which preserve small colimits. Then precomposition with h induces an equivalence of ∞ -categories $\text{Fun}'(\widehat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\sim} \text{Fun}(\mathcal{C}, \mathcal{D})$.

Remark 8.4.0.2. Stated more informally, condition (2) of Definition 8.4.0.1 asserts that if $f : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories where \mathcal{D} admits small colimits, then f factors (up to isomorphism) as a composition $\mathcal{C} \xrightarrow{h} \widehat{\mathcal{C}} \xrightarrow{F} \mathcal{D}$, where the functor F preserves small colimits; moreover, this factorization is required to be essentially unique. In other words, the ∞ -category $\widehat{\mathcal{C}}$ should be “freely generated” by \mathcal{C} under small colimits.

It follows immediately from the definition that if an ∞ -category \mathcal{C} admits a cocompletion $\widehat{\mathcal{C}}$, then $\widehat{\mathcal{C}}$ is determined uniquely up to equivalence. Our primary goal in this section is to prove the following existence result:

Theorem 8.4.0.3. Let \mathcal{C} be an essentially small ∞ -category and let $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ be a covariant Yoneda embedding for \mathcal{C} (Definition 8.3.3.9). Then h_\bullet exhibits $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ as a cocompletion of \mathcal{C} (in the sense of Definition 8.4.0.1).

Example 8.4.0.4. Let X be a contractible Kan complex, which we identify with a vertex x of the simplicial set \mathcal{S} . Applying Theorem 8.4.0.3 in the special case where $\mathcal{C} = \Delta^0$, we deduce that the map $x : \Delta^0 \rightarrow \mathcal{S}$ exhibits \mathcal{S} as a cocompletion of the 0-simplex Δ^0 . That is, for every ∞ -category \mathcal{D} which admits small colimits, the evaluation map

$$\text{Fun}'(\mathcal{S}, \mathcal{D}) \rightarrow \mathcal{D} \quad F \mapsto F(X)$$

is an equivalence of ∞ -categories, where $\text{Fun}'(\mathcal{S}, \mathcal{D})$ denotes the full subcategory of $\text{Fun}(\mathcal{S}, \mathcal{D})$ spanned by the colimit-preserving functors. Note that this property characterizes the ∞ -category \mathcal{S} up to equivalence: it is “freely generated” under small colimits by the object Δ^0 .

Warning 8.4.0.5. In §8.4.5, we will show that *every* ∞ -category \mathcal{C} admits a cocompletion $\widehat{\mathcal{C}}$ (Proposition 8.4.5.3). Beware that, if \mathcal{C} is not essentially small, then $\widehat{\mathcal{C}}$ cannot necessarily be identified with the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ (Warning 8.4.3.4). However, if \mathcal{C} is *locally* small, then it can be identified with a full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ (see Construction 8.4.5.5).

Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{C} is essentially small and \mathcal{D} admits small colimits. Using the ∞ -categorical version of Yoneda's lemma (Theorem 8.3.3.13), we see that f factors (up to isomorphism) as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \xrightarrow{F_0} \mathcal{D},$$

where $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ denotes the full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ spanned by the representable functors. Theorem 8.4.0.3 asserts that F_0 admits an essentially unique extension to a functor $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ which preserves small colimits. To prove this, it will be useful to characterize this extension in a different way. For any functor $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$, we will show that the following conditions are equivalent:

- (a) The functor F preserves small colimits.
- (b) The functor F is left Kan extended from the subcategory $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.

Granting this equivalence, the proof of Theorem 8.4.0.3 is reduced to showing that every functor $F_0 : \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ admits an essentially unique left Kan extension $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$, which follows from the general results of §7.3.

To establish the equivalence of (a) and (b), we will proceed by reduction to an important special case. Suppose that $\mathcal{D} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ and that $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ is the identity functor. In this case, condition (a) is automatically satisfied. Condition (b) then asserts that the full subcategory $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is *dense*: that is, every object $\mathcal{G} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ can be recovered as the colimit of the diagram

$$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \times_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$$

of representable functors over \mathcal{G} (see Definition 8.4.1.5). In §8.4.1, we discuss dense subcategories in general and provide a concrete criterion can be used to show that a subcategory is dense (Proposition 8.4.1.8). In §8.4.2, we apply this criterion to establish the density of the full subcategory $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ (Corollary 8.4.2.2). In §8.4.3, we use this result to establish the equivalence of (a) and (b) in general (Theorem 8.4.3.6), and deduce Theorem 8.4.0.3 as an easy consequence.

Let us now specialize the preceding discussion to the situation where the ∞ -category \mathcal{D} is locally small. In this case, we will show that conditions (a) and (b) above are equivalent to the following:

- (c) The functor $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ admits a right adjoint $G : \mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.

The implication (c) \Rightarrow (a) is formal (by virtue of Corollary 7.1.3.21, every left adjoint preserves colimits). In §8.4.4, we prove the reverse implication by giving an explicit construction of the right adjoint G : it carries each object $D \in \mathcal{D}$ to the functor

$$\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S} \quad C \mapsto \text{Hom}_{\mathcal{D}}(f(C), D)$$

where $\text{Hom}_{\mathcal{D}}(\bullet, \bullet)$ is a Hom-functor for the ∞ -category \mathcal{D} (see Proposition 8.4.4.1). The equivalence of (a) and (c) is a special case of the ∞ -categorical adjoint functor theorem (Theorem [?]), which we discuss in §[?].

If \mathcal{C} is an essentially small ∞ -category, then its cocompletion $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is a drastic enlargement of \mathcal{C} , obtained by (freely) adjoining a colimit for *every* small diagram. In practice, it will be useful to consider a variant of Definition 8.4.0.1, where we restrict our attention to diagrams indexed by some collection of simplicial sets \mathbb{K} . We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} if $\widehat{\mathcal{C}}$ admits K -indexed colimits for each $K \in \mathbb{K}$, and is universal with respect to this property (see Definition 8.4.5.1). In §8.4.5, we show that every ∞ -category \mathcal{C} admits a \mathbb{K} -cocompletion $\widehat{\mathcal{C}}$ (Proposition 8.4.5.3). Our proof proceeds by explicit construction. Assume for simplicity that the ∞ -category \mathcal{C} and each of the simplicial sets $K \in \mathbb{K}$ is essentially small; in this case, we show that we can take $\widehat{\mathcal{C}}$ to be the smallest full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ which contains all representable functors and is closed under K -indexed colimits, for each $K \in \mathbb{K}$ (Construction 8.4.5.5 and Proposition 8.4.5.7).

Let us isolate another important feature of the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ associated to an essentially small ∞ -category \mathcal{C} . For every pair of objects $X \in \mathcal{C}$ and $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, the ∞ -categorical analogue of Yoneda's lemma supplies a homotopy equivalence

$$\text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})}(h_X, \mathcal{F}) \xrightarrow{\sim} \mathcal{F}(X)$$

(Proposition 8.3.1.3). It follows that h_X is an *atomic* object of the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$: that is, it corepresents a functor which preserves small colimits (Definition 8.4.6.1). The Yoneda embedding is essentially characterized by this property, together with the fact that it is dense and fully faithful. More precisely, suppose that we are given a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, where \mathcal{C} is small and $\widehat{\mathcal{C}}$ admits small colimits. In §8.4.6, we show that h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of \mathcal{C} if and only if it is dense, fully faithful, and carries each object of \mathcal{C} to an atomic object of $\widehat{\mathcal{C}}$ (Proposition 8.4.6.6). In §8.4.7, we apply this characterization to show that the formation of cocompletions is compatible with the formation of slice ∞ -categories (Proposition 8.4.7.1). In particular, if $U : \widetilde{\mathcal{C}} \rightarrow \mathcal{C}$ is a right fibration between essentially small ∞ -categories, we show that there is an equivalence of ∞ -categories $\text{Fun}(\widetilde{\mathcal{C}}^{\text{op}}, \mathcal{S}) \simeq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}}$, where \mathcal{F} denotes a covariant transport representation for the left fibration U^{op} (Corollary 8.4.7.2).

8.4.1 Dense Functors

To study the behavior of a (large) category \mathcal{D} , it is often useful to approximate \mathcal{D} by well-chosen (small) subcategory $\mathcal{C} \subseteq \mathcal{D}$. The following condition guarantees that, for some purposes, passage from \mathcal{D} to \mathcal{C} does not lose too much information:

- 03V9 **Definition 8.4.1.1.** Let \mathcal{D} be a (locally small) category. We say that a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is *dense* if the functor

$$\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \text{Set}) \quad Y \mapsto \text{Hom}_{\mathcal{D}}(\bullet, Y)$$

is fully faithful.

- 03VA **Remark 8.4.1.2.** Definition 8.4.1.1 was introduced by Isbell in [30]. Beware that Isbell uses the term *left adequate* subcategory for what we refer to as a *dense* subcategory.

- 03VB **Example 8.4.1.3.** Let Cat denote the ordinary category whose objects are small categories and whose morphisms are functors, and let $\Delta \subset \text{Cat}$ be the simplex category. Proposition 1.2.2.1 asserts that the restricted Yoneda embedding

$$\text{Cat} \rightarrow \text{Fun}(\Delta^{\text{op}}, \text{Set}) = \text{Set}_{\Delta} \quad \mathcal{C} \mapsto N_{\bullet}(\mathcal{C})$$

is fully faithful, so that Δ is a dense subcategory of Cat .

- 03VC **Exercise 8.4.1.4.** Let \mathcal{C} denote the category of partially ordered sets, and let $\Delta_{\leq 1}$ denote the full subcategory of \mathcal{C} spanned by the objects $[0]$ and $[1]$. Show that $\Delta_{\leq 1}$ is a dense subcategory of \mathcal{C} .

We now introduce an ∞ -categorical counterpart of Definition 8.4.1.1.

- 03VD **Definition 8.4.1.5.** Let \mathcal{D} be an ∞ -category. We will say that a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is *dense* if, for every object $X \in \mathcal{D}$, the composition

$$(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X})^{\triangleright} \hookrightarrow \mathcal{D}_{/X}^{\triangleright} \rightarrow \mathcal{D}$$

is a colimit diagram.

- 03VE **Remark 8.4.1.6.** Let \mathcal{D} be an ∞ -category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense if and only if the identity functor $\text{id}_{\mathcal{D}}$ is left Kan extended from \mathcal{C} .

- 03VF **Example 8.4.1.7.** Let \mathcal{C} be an ∞ -category. Then \mathcal{C} is a dense full subcategory of itself (see Example 7.3.3.8).

In the situation of Definition 8.4.1.5, suppose that the ∞ -category \mathcal{D} is locally small, and let $h_{\bullet} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S})$ be a covariant Yoneda embedding for \mathcal{D} (see Definition 8.3.3.9). Composing with the restriction functor $\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, we obtain a functor

$$\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad Y \mapsto h_Y^{\circ}$$

which we will refer to as the *restricted Yoneda embedding*.

Proposition 8.4.1.8. *Let \mathcal{D} be a locally small ∞ -category. A full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is 03VG dense if and only if the restricted Yoneda embedding $\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is fully faithful.*

We will deduce Proposition 8.4.1.8 from a more general result (Proposition 8.4.1.22), which we prove at the end of this section.

Corollary 8.4.1.9. *Let \mathcal{D} be a locally small category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is 03VH dense (in the sense of Definition 8.4.1.1) if and only if $N_{\bullet}(\mathcal{C})$ is a dense subcategory of the ∞ -category $N_{\bullet}(\mathcal{D})$ (in the sense of Definition 8.4.1.5).*

Warning 8.4.1.10. Let \mathcal{D} be an ∞ -category. Consider the following conditions on a full 03VJ subcategory $\mathcal{C} \subseteq \mathcal{D}$:

- (1) The ∞ -category $\mathcal{C} \subseteq \mathcal{D}$ is dense, in the sense of Definition 8.4.1.5.
- (2) Every object $X \in \mathcal{D}$ can be realized as the colimit of a diagram taking values in the full subcategory $\mathcal{C} \subseteq \mathcal{D}$.
- (3) The ∞ -category \mathcal{D} is generated by \mathcal{C} under colimits. That is, if $\mathcal{D}_0 \subseteq \mathcal{D}$ is a full subcategory which contains \mathcal{C} and is closed under the formation of colimits in \mathcal{D} , then $\mathcal{D}_0 = \mathcal{D}$.

It follows immediately from the definitions that (1) \Rightarrow (2) \Rightarrow (3). Beware that neither of this implications is reversible. See Exercises 8.4.1.11 and 8.4.1.12.

Exercise 8.4.1.11. Let \mathcal{D} denote the category of free abelian groups, and let $\mathcal{C} \subseteq \mathcal{D}$ denote 03VK the full subcategory spanned by object \mathbf{Z} . Show that \mathcal{C} is not a dense subcategory of \mathcal{D} . Consequently, the inclusion map $N_{\bullet}(\mathcal{C}) \subset N_{\bullet}(\mathcal{D})$ satisfies condition (2) of Warning 8.4.1.10, but does not satisfy condition (1).

Exercise 8.4.1.12. Let Cat denote the (ordinary) category of small categories, and let 03VL $\Delta_{\leq 1} \subset \text{Cat}$ denote the full subcategory spanned by the objects [0] and [1]. Show that:

- The full subcategory $\Delta_{\leq 1}$ generates Cat under colimits.
- A small category \mathcal{C} can be realized as the colimit (in Cat) of a diagram $\mathcal{K} \rightarrow \Delta_{\leq 1}$ if and only if the category \mathcal{C} is free, in the sense of Definition 1.2.6.7.

In particular, the inclusion $N_{\bullet}(\Delta_{\leq 1}) \subset N_{\bullet}(\text{Cat})$ satisfies condition (3) of Warning 8.4.1.10, but does not satisfy condition (2).

Warning 8.4.1.13 (Failure of Transitivity). Let \mathcal{E} be an ∞ -category and let $\mathcal{C} \subseteq \mathcal{D} \subseteq \mathcal{E}$ 03VM be full subcategories. Suppose that \mathcal{C} is a dense subcategory of \mathcal{E} . Then \mathcal{C} is also a dense subcategory of \mathcal{D} , and \mathcal{D} is a dense subcategory of \mathcal{E} (see Corollary 7.3.8.8). Beware that the converse is false (Example 8.4.1.14).

03VN **Example 8.4.1.14.** Let Cat denote the (ordinary) category of small categories. Then the simplex category Δ is a dense full subcategory of Cat (Example 8.4.1.3), and $\Delta_{\leq 1}$ is a dense full subcategory of Δ (Exercise 8.4.1.4). However, $\Delta_{\leq 1}$ is not a dense full subcategory of Cat (Exercise 8.4.1.12).

For some applications, it will be useful to consider the following generalization of Definition 8.4.1.5.

03VP **Definition 8.4.1.15.** Let \mathcal{D} be an ∞ -category and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. We say that F is *dense* if the identity transformation $\text{id}_F : F \rightarrow \text{id}_{\mathcal{D}} \circ F$ exhibits the identity functor $\text{id}_{\mathcal{D}}$ as a left Kan extension of F along F (see Variant 7.3.1.5).

03VQ **Example 8.4.1.16.** Let \mathcal{D} be an ∞ -category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense (in the sense of Definition 8.4.1.5) if and only if the inclusion functor $\mathcal{C} \hookrightarrow \mathcal{D}$ is dense (in the sense of Definition 8.4.1.15). See Proposition 7.3.2.5.

03VS **Remark 8.4.1.17** (Homotopy Invariance). Let \mathcal{D} be an ∞ -category, let C be a simplicial set, and let $F, F' : \mathcal{C} \rightarrow \mathcal{D}$ be diagrams which are isomorphic (when viewed as objects of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$). Then F is dense if and only if F' is dense. This follows by combining Remarks 7.3.1.10 and 7.3.1.11.

03VT **Remark 8.4.1.18** (Change of Source). Let \mathcal{D} be an ∞ -category, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets, and let $G : \mathcal{B} \rightarrow \mathcal{C}$ be a categorical equivalence of simplicial sets. Then F is dense if and only if $F \circ G$ is dense. See Proposition 7.3.1.14.

03VU **Remark 8.4.1.19** (Change of Target). Let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then:

- If G is fully faithful and $G \circ F$ is dense, then F is dense.
- If G is an equivalence of ∞ -categories and F is dense, then $G \circ F$ is dense.

See Remark 7.3.1.13.

03VV **Remark 8.4.1.20.** Let \mathcal{D} be an ∞ -category and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then f is dense if and only if, for every object $Y \in \mathcal{D}$, the composite map

$$(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/Y})^{\triangleright} \rightarrow \mathcal{D}_{/Y}^{\triangleright} \rightarrow \mathcal{D}$$

is a colimit diagram in \mathcal{D} .

03VW **Remark 8.4.1.21.** Let κ be an uncountable regular cardinal and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Assume that \mathcal{C} is essentially κ -small and that \mathcal{D} is a locally κ -small ∞ -category. Then, for each object $X \in \mathcal{D}$, the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X}$ is also

essentially κ -small (Corollary 5.4.9.16). Let λ be an infinite cardinal satisfying $\text{ecf}(\lambda) \geq \kappa$ (see Definition 5.4.3.16). Then F is dense if and only if, for every representable functor $h_Y : \mathcal{D}^{\text{op}} \rightarrow \mathcal{S}^{<\lambda}$, the identity transformation $\text{id} : h_Y \circ F^{\text{op}} \rightarrow h_Y \circ F^{\text{op}}$ exhibits the functor h_Y as a right Kan extension of $h_Y \circ F^{\text{op}}$ along F^{op} . This follows by combining Remark 8.4.1.20 with Proposition 7.4.5.13 (together with Remark 7.4.5.15).

Proposition 8.4.1.22. *Let λ be an uncountable cardinal, let \mathcal{D} be an ∞ -category which is 03VX locally λ -small, and let*

$$h_{\bullet} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda}) \quad Y \mapsto h_Y$$

be a covariant Yoneda embedding for \mathcal{D} (Definition 8.3.3.9). If \mathcal{C} is a simplicial set, then a diagram $F : \mathcal{C} \rightarrow \mathcal{D}$ is dense if and only if the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{\circ F^{\text{op}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$$

is fully faithful.

Proof. Choose an uncountable cardinal κ such that \mathcal{C} is essentially κ -small and \mathcal{D} is locally κ -small. Enlarging λ if necessary, we may assume that the exponential cofinality of λ is $\geq \kappa$ (see Remark 5.4.3.19). For each object $Y \in \mathcal{D}$, let $h_Y^{\circ} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\lambda}$ denote the composite functor $h_Y \circ F^{\text{op}}$, given on objects by the construction $C \mapsto \text{Hom}_{\mathcal{D}}(F(C), Y)$. By virtue of Remark 8.4.1.21, it will suffice to show that the following conditions are equivalent:

- (1_Y) The identity transformation $\text{id} : h_Y \circ F^{\text{op}} \rightarrow h_Y$ exhibits h_Y as a right Kan extension of h_Y° along the functor F^{op} .
- (2_Y) For each object $X \in \mathcal{C}$, the composite map

$$\text{Hom}_{\mathcal{D}}(X, Y) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S})}(h_X, h_Y) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})}(h_X^{\circ}, h_Y^{\circ})$$

is a homotopy equivalence of Kan complexes.

Since the covariant Yoneda embedding $X \mapsto h_X$ is fully faithful (Theorem 8.3.3.13), we can reformulate (2_Y) as follows:

- (2'_Y) The restriction map

$$\text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X, h_Y) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X^{\circ}, h_Y^{\circ})$$

is a homotopy equivalence of Kan complexes.

The inequality $\kappa \leq \text{ecf}(\lambda)$ guarantees that the ∞ -category $\mathcal{S}^{<\lambda}$ admits κ -small limits (Corollary 7.4.1.12). Using Proposition 7.6.7.13, we can choose a functor $\mathcal{G} : \mathcal{D}^{\text{op}} \rightarrow \mathcal{S}^{<\lambda}$ and a natural transformation $\alpha : \mathcal{G} \circ F^{\text{op}} \rightarrow h_Y^\circ$ which exhibits \mathcal{G} as a right Kan extension of h_Y° along the functor F^{op} . Invoking the universal mapping property of \mathcal{G} (Proposition 7.3.6.1), we see that there exists a natural transformation $\beta : h_Y \rightarrow \mathcal{G}$ and a commutative diagram

03VY

$$\begin{array}{ccc} & \mathcal{G} \circ F^{\text{op}} & \\ \beta \swarrow & & \searrow \alpha \\ h_Y \circ F^{\text{op}} & \xrightarrow{\text{id}} & h_Y^\circ \end{array} \quad (8.51)$$

in the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$. Using Remark 7.3.1.12, we see that condition (1_Y) is satisfied if and only if the natural transformation β is an isomorphism: that is, it induces a homotopy equivalence of Kan complexes $\beta_X : h_Y(X) \rightarrow \mathcal{G}(X)$ for each object $X \in \mathcal{D}$ (Theorem 4.4.4.4). Combining this observation with Proposition 8.3.1.3, we can reformulate (1_Y) as follows:

$(1'_Y)$ For each object $X \in \mathcal{C}$, precomposition with β induces a homotopy equivalence

$$\text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X, h_Y) \xrightarrow{\circ[\beta]} \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X, \mathcal{G}).$$

Using the commutativity of (8.51), we see that the diagram of Kan complexes

$$\begin{array}{ccc} & \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X, \mathcal{G}) & \\ \circ[\beta] \nearrow & & \searrow \\ \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X, h_Y) & \xrightarrow{\quad} & \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})}(h_X^\circ, h_Y^\circ) \end{array}$$

commutes up to homotopy, where the diagonal map on the right is the homotopy equivalence of Proposition 7.3.6.1. It follows that conditions $(1'_Y)$ and $(2'_Y)$ are equivalent. \square

Proof of Proposition 8.4.1.8. Let \mathcal{D} be a locally small ∞ -category and let $\mathcal{C} \subseteq \mathcal{D}$ be a full subcategory. By virtue of Example 8.4.1.16, it will suffice to show that the inclusion functor $\mathcal{C} \hookrightarrow \mathcal{D}$ is dense if and only if the restricted Yoneda embedding $\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is fully faithful. Following the convention of Remark 5.4.0.5, this is a special case of Proposition 8.4.1.22. \square

Proposition 8.4.1.23. *Let \mathcal{D} be an ∞ -category, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial 03VZ sets, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be a full subcategory which contains the image of F . If F is dense, then the subcategory \mathcal{D}_0 is dense.*

Proof. Using Proposition 4.1.3.2, we can factor F as a composition $\mathcal{C} \xrightarrow{F'} \mathcal{C}' \xrightarrow{F''} \mathcal{D}$, where F' is inner anodyne and F'' is an inner fibration. Using Remark 8.4.1.18, we see that the functor F' is dense. Replacing F by F'' , we can reduce to proving Proposition 8.4.1.23 in the special case where \mathcal{C} is an ∞ -category.

Let γ denote the identity map id_F , which we regard as a natural transformation from F to $\text{id}_{\mathcal{D}} \circ F$. Our assumption that F is dense guarantees that γ exhibits $\text{id}_{\mathcal{D}}$ as a left Kan extension of F along F . To avoid confusion, let us write F_0 to denote the functor F , regarded as a functor from \mathcal{C} to \mathcal{D}_0 . Let $\iota : \mathcal{D}_0 \hookrightarrow \mathcal{D}$ denote the inclusion map, so that $F = \iota \circ F_0$. We can therefore also regard the identity map id_F as a natural transformation $\alpha : F \rightarrow \iota \circ F_0$. Our assumption that F is dense also guarantees that α exhibits ι as a left Kan extension of F along F_0 . Note that $\gamma = \text{id}_F$ is a composition of $\alpha = \text{id}_F$ with $\beta|_{\mathcal{C}}$, where $\beta = \text{id}_{\iota}$ is the identity transformation from ι to itself. Invoking the transitivity of Kan extensions (Proposition 7.3.8.18), we deduce that β exhibits the identity functor $\text{id}_{\mathcal{D}}$ as a left Kan extension of ι along itself: that is, the functor ι is dense. Applying Example 8.4.1.16, we conclude that \mathcal{D}_0 is a dense subcategory of \mathcal{D} . \square

Remark 8.4.1.24. Let \mathcal{D} be an ∞ -category and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a dense diagram. Choose 03W0 another diagram $q : K \rightarrow \mathcal{D}$ and set $\tilde{\mathcal{D}} = \mathcal{D}_{/q}$, so that the projection map $\pi : \tilde{\mathcal{D}} \rightarrow \mathcal{D}$ is a right fibration. Then the projection map $\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}} \rightarrow \tilde{\mathcal{D}}$ is dense. To prove this, it will suffice to show that for every object $Y \in \tilde{\mathcal{D}}$, the induced map

$$\theta : (\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}})^\triangleright \rightarrow \tilde{\mathcal{D}}_{/Y}^\triangleright \rightarrow \tilde{\mathcal{D}}$$

is a colimit diagram in $\tilde{\mathcal{D}}$ (Remark 8.4.1.20). By virtue of Proposition 7.1.3.19, this is equivalent to the requirement that $\pi \circ \theta$ is a colimit diagram in \mathcal{D} . Unwinding the definitions, we see that $\pi \circ \theta$ is given by the composition

$$(\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}})^\triangleright \rightarrow (\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/\pi(Y)})^\triangleright \rightarrow \mathcal{D}_{/\pi(Y)}^\triangleright \rightarrow \mathcal{D}.$$

Since π is a right fibration, the map $\tilde{\mathcal{D}}_{/Y} \rightarrow \mathcal{D}_{/\pi(Y)}$ is a trivial Kan fibration (Proposition 4.3.7.12). Using Corollary 7.2.2.2, we are reduced to showing that the map $(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/\pi(Y)})^\triangleright \rightarrow \mathcal{D}_{/\pi(Y)}^\triangleright \rightarrow \mathcal{D}$ is a colimit diagram, which follows from our assumption that F is dense (Remark 8.4.1.20).

8.4.2 Density of Yoneda Embeddings

Our goal in this section is to prove the following result, which supplies an important 03W1 source of examples of dense functors:

03W2 **Theorem 8.4.2.1.** *Let \mathcal{C} be a locally small ∞ -category, and let $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ be a covariant Yoneda embedding (Definition 8.3.3.9). Then h_\bullet is a dense functor.*

Since the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is fully faithful, Theorem 8.4.2.1 can be reformulated as follows:

03W3 **Corollary 8.4.2.2.** *Let \mathcal{C} be a locally small ∞ -category and let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ denote the full subcategory spanned by the representable functors. Then $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is a dense subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.*

Proof. By virtue of Example 8.4.1.16, it will suffice to show that the inclusion map $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}) \hookrightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is a dense functor. Since the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is an equivalence of ∞ -categories (Theorem 8.3.3.13), this is equivalent to the assertion that h_\bullet is a dense functor from \mathcal{C} to $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ (Remark 8.4.1.18), which follows from Theorem 8.4.2.1. \square

03W4 **Example 8.4.2.3.** Let $\mathcal{S}_{\text{cont}}$ denote the full subcategory of \mathcal{S} spanned by the contractible Kan complexes. Then $\mathcal{S}_{\text{cont}}$ is a dense subcategory of \mathcal{S} . This follows by applying Corollary 8.4.2.2 in the special case $\mathcal{C} = \Delta^0$. Moreover, the same assertion holds if we replace $\mathcal{S}_{\text{cont}}$ by any nonempty subcategory of itself; for example, the full subcategory of \mathcal{S} spanned by the standard 0-simplex Δ^0 .

By virtue of the convention of Remark 5.4.0.5, Theorem 8.4.2.1 can be regarded as a special case of the following:

03W5 **Variant 8.4.2.4.** Let κ be an uncountable cardinal and let \mathcal{C} be an ∞ -category which is locally κ -small. Then the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is a dense functor.

We will deduce Variant 8.4.2.4 from a more precise result. Recall that, if X is an object of a (locally small) ∞ -category \mathcal{C} , then the representable functor $h_X \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ corepresents the evaluation functor $\text{ev}_X : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{S}$ (Remark 8.3.1.5). That is, for every functor $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$, there is a canonical homotopy equivalence

$$\mathcal{F}(X) \xrightarrow{\sim} \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})}(h_X, \mathcal{F}),$$

which depends functorially on \mathcal{F} . The following result guarantees that this homotopy equivalence can also be chosen to depend functorially on X :

03W6 **Proposition 8.4.2.5.** *Let κ be an uncountable cardinal and let \mathcal{C} be an ∞ -category which is locally κ -small. Then the profunctor*

$$\text{ev} : \mathcal{C}^{\text{op}} \times \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{S}^{<\kappa} \quad (X, \mathcal{F}) \mapsto \mathcal{F}(X)$$

is corepresentable by the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$.

Proof. Let $\text{Tw}(\mathcal{C})$ denote the twisted arrow ∞ -category of \mathcal{C} , let $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ be the left fibration of Proposition 8.1.1.11, and let $\underline{\Delta}^0_{\text{Tw}(\mathcal{C})}$ denote the constant functor $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{S}^{<\kappa}$. Let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ denote the composition $\text{ev} \circ (\text{id} \times h_{\bullet})$, so that \mathcal{H} is a Hom-functor for \mathcal{C} . We can therefore choose a natural transformation

$$\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H} \circ \lambda = \text{ev} \circ (\text{id} \times h_{\bullet}) \circ \lambda$$

which exhibits \mathcal{H} as a Hom-functor for \mathcal{C} , in the sense of Definition 8.3.5.1. By virtue of Proposition 8.3.4.15, it will suffice to show that the natural transformation α also exhibits the profunctor ev as corepresented by the functor h_{\bullet} , in the sense of Variant 8.3.4.16. Fix an object $X \in \mathcal{C}$, so that α carries the object $\text{id}_X \in \text{Tw}(\mathcal{C})$ to a vertex $\eta \in \mathcal{H}(X, X) = \text{ev}(X, h_X)$. We wish to show that η exhibits evaluation functor $\text{ev}_X : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{S}^{<\kappa}$ as corepresented by h_X . This follows from Proposition 8.3.1.3, since η exhibits the functor h_X as represented by X . \square

Example 8.4.2.6. Let \mathcal{C} be a locally small category. Then the evaluation profunctor 03W7

$$\text{ev} : \mathcal{C}^{\text{op}} \times \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{S} \quad (X, \mathcal{F}) \mapsto \mathcal{F}(X)$$

is corepresentable by the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.

Proof of Variant 8.4.2.4. Let κ be an uncountable cardinal and let \mathcal{C} be an ∞ -category which is locally κ -small. We wish to show that the covariant Yoneda embedding $h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is dense. Choose a cardinal $\lambda \geq \kappa$ for which the ∞ -category $\mathcal{D} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is locally λ -small, and let $h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda})$ be a covariant Yoneda embedding for \mathcal{D} . By virtue of Proposition 8.4.1.22, it will suffice to show that the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}^{\mathcal{D}}} \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{\circ h_{\bullet}^{\mathcal{C}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$$

is fully faithful. Applying Proposition 8.4.2.5, we see that this functor is isomorphic to the inclusion of $\mathcal{D} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ as a full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$. \square

Using Proposition 8.4.2.5, we can also give an alternative characterization of the covariant transport representation associated to a left fibration of ∞ -categories.

Corollary 8.4.2.7. *Let \mathcal{C} be a locally κ -small ∞ -category, let $U : \tilde{\mathcal{C}} \rightarrow \mathcal{C}$ be a right fibration, 04BB and let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$ be a functor. The following conditions are equivalent:*

- (1) *The functor \mathcal{F} is a covariant transport representation for the left fibration $U^{\text{op}} : \tilde{\mathcal{C}}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$.*

(2) There exists a categorical pullback square

$$\begin{array}{ccc} \tilde{\mathcal{C}} & \longrightarrow & \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}} \\ \downarrow U & & \downarrow \\ \mathcal{C} & \xrightarrow{h_{\bullet}} & \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \end{array}$$

where h_{\bullet} is a covariant Yoneda embedding for \mathcal{C} .

Proof. Choose a cardinal $\lambda \geq \kappa$ such that $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is locally λ -small, and let $H : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})^{\text{op}} \rightarrow \mathcal{S}^{<\lambda}$ be a functor represented by $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. It follows from Proposition 5.7.6.21 that H is a covariant transport representation for the left fibration $(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}})^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})^{\text{op}}$. Consequently, if condition (2) is satisfied, then $H \circ h_{\bullet}^{\text{op}}$ is a covariant transport representation for the left fibration U^{op} . Proposition 8.4.2.5 implies that $H \circ h_{\bullet}^{\text{op}}$ is isomorphic to \mathcal{F} . This proves the implication (2) \Rightarrow (1), and the reverse implication follows from the fact that the equivalence class of a left fibration is determined by its covariant transport representation (Corollary 5.7.0.6). \square

8.4.3 Cocompletion via the Yoneda Embedding

03W8 Let \mathcal{C} be an essentially small ∞ -category. Our goal in this section is to prove Theorem 8.4.0.3, which asserts that the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ exhibits $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ as a cocompletion of \mathcal{C} . We begin by formulating a slightly more general assertion.

04BC **Notation 8.4.3.1.** Let κ be an uncountable regular cardinal. If \mathcal{C} and \mathcal{D} are κ -cocomplete ∞ -categories, we let $\text{Fun}^{\kappa}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors $F : \mathcal{C} \rightarrow \mathcal{D}$ which preserve κ -small colimits.

04BD **Definition 8.4.3.2.** Let κ be an uncountable regular cardinal. We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a κ -cocompletion of \mathcal{C} if the following conditions are satisfied:

- (1) The ∞ -category $\widehat{\mathcal{C}}$ is κ -cocomplete.
- (2) For every κ -cocomplete ∞ -category \mathcal{D} , precomposition with h induces an equivalence of ∞ -categories $\text{Fun}^{\kappa}(\widehat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\sim} \text{Fun}(\mathcal{C}, \mathcal{D})$.

Following the convention of Remark 5.4.0.5, we can regard Theorem 8.4.0.3 as a special case of the following more general assertion:

Theorem 8.4.3.3. *Let κ be an uncountable regular cardinal, let \mathcal{C} be an ∞ -category which is essentially κ -small, and let $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding for \mathcal{C} . Then h_\bullet exhibits $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ as a κ -cocompletion of \mathcal{C} .*

Warning 8.4.3.4. The conclusion of Theorem 8.4.3.3 is not necessarily satisfied if we assume only that \mathcal{C} is locally κ -small. For example, suppose that $\mathcal{C} = S$ is a set of cardinality κ (regarded as a discrete simplicial set), and let \mathcal{D} be (the nerve of) the partially ordered set $\{0 < 1\}$. Then we can identify objects of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ with collections of κ -small Kan complexes $\{X_s\}_{s \in S}$. Define a functor $\lambda : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{D}$ by the formula

$$\lambda(\{X_s\}_{s \in S}) = \begin{cases} 0 & \text{if } |\{s \in S : X_s \neq \emptyset\}| < \kappa \\ 1 & \text{otherwise,} \end{cases}$$

and let $\lambda_0 : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{D}$ be the constant functor taking the value 0. The functors λ and λ_0 both preserve κ -small colimits and coincide on the image of the Yoneda embedding h_\bullet , but do not coincide in general.

The proof of Theorem 8.4.3.3 will require some preliminaries. Let κ be an uncountable cardinal, and let \mathcal{C} be an ∞ -category which is locally κ -small. In what follows, we let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ denote the full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ spanned by the representable functors $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$. We will need the following elementary observation:

Lemma 8.4.3.5. *Let κ be an uncountable regular cardinal, let \mathcal{C} be an ∞ -category which is essentially κ -small, and let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$ be a functor. Then the ∞ -category*

$$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}} = \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \times_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}}$$

is essentially κ -small.

Proof. The ∞ -category $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is equivalent to \mathcal{C} (Theorem 8.3.3.13), and is therefore essentially κ -small. Since κ is regular, it will suffice to show that each fiber of the right fibration $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is an essentially κ -small Kan complex (Corollary 5.4.9.16). Equivalently, we must show that for each object $\mathcal{G} \in \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$, the mapping space $X = \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})}(\mathcal{G}, \mathcal{F})$ is essentially κ -small. This follows from Proposition 8.3.1.3: if \mathcal{G} is representable by the object $C \in \mathcal{C}$, then X is homotopy equivalent to the κ -small Kan complex $\mathcal{F}(C)$. \square

We will deduce Theorem 8.4.3.3 from the following more precise assertion:

Theorem 8.4.3.6. *Let κ be an uncountable regular cardinal, let \mathcal{C} be an ∞ -category which is essentially κ -small, and let $T : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:*

- (1) *The functor T preserves κ -small colimits.*
- (2) *The functor T is left Kan extended from the full subcategory $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$.*

Proof. We first show that (1) implies (2). Assume that the functor T preserves κ -small colimits and let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$ be a functor; we wish to show that the composite functor

$$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}}^{\triangleright} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{T} \mathcal{D}$$

is a colimit diagram in the ∞ -category \mathcal{D} . Lemma 8.4.3.5 guarantees that the ∞ -category $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}}$ is essentially κ -small. Since T preserves κ -small colimits, it will suffice to show that the map $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}}^{\triangleright} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is a colimit diagram (Remark 7.6.7.6), which follows from Corollary 8.4.2.2.

We now show that (2) implies (1). Assume that T is left Kan extended from the ∞ -category $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$; we wish to show that it preserves κ -small colimits. Choose a cardinal λ such that \mathcal{D} is locally λ -small. Enlarging λ if necessary, we may assume that it has exponential cofinality $\geq \kappa$ (Remark 5.4.3.19). By virtue of Proposition 7.4.5.13 (and Remark 7.4.5.15), it will suffice to show that for every representable functor $H : \mathcal{D}^{\text{op}} \rightarrow \mathcal{S}^{<\lambda}$, the composition $H^{\text{op}} \circ T$ preserves κ -small colimits. Since H^{op} preserves κ -small colimits (Proposition 7.4.5.13 and Remark 7.4.5.15), the functor $H^{\text{op}} \circ T$ is left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. Consequently, to show that (2) implies (1), we may replace T by $H^{\text{op}} \circ T$ and thereby reduce to the case where $\mathcal{D} = (\mathcal{S}^{<\lambda})^{\text{op}}$, for some cardinal λ of exponential cofinality $\geq \kappa$.

Let $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding for \mathcal{C} , and let \mathcal{F} denote the composite functor

$$\mathcal{C}^{\text{op}} \xrightarrow{h_{\bullet}^{\text{op}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})^{\text{op}} \xrightarrow{T^{\text{op}}} \mathcal{S}^{<\lambda}.$$

Using Remark 5.4.3.19 again, we can choose a cardinal $\lambda' \geq \lambda$ of exponential cofinality $\geq \kappa$ such that $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$ is locally λ' -small. In what follows, we abuse notation by identifying T with the composite functor $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{T} (\mathcal{S}^{<\lambda})^{\text{op}} \hookrightarrow (\mathcal{S}^{<\lambda'})^{\text{op}}$. Note that, since the inclusion $\mathcal{S}^{<\lambda} \hookrightarrow \mathcal{S}^{<\lambda'}$ preserves κ -small limits (see Variant 7.4.5.8), this composite functor is also left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$.

Let $H' : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})^{\text{op}} \rightarrow \mathcal{S}^{<\lambda'}$ be a functor represented by $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda})$, and let U denote the composite functor

$$\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\lambda}) \xrightarrow{H'^{\text{op}}} (\mathcal{S}^{<\lambda'})^{\text{op}}.$$

Applying Proposition 8.4.2.5, we see that the composition $U \circ h_{\bullet}$ is isomorphic to the functor $\mathcal{F} = T \circ h_{\bullet}$. Since the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is an equivalence of ∞ -categories (Theorem 8.3.3.13), it follows that the functors U and T are

isomorphic when restricted to $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. Proposition 7.4.5.13 and Remark 7.4.5.15 guarantee that the functor U preserves κ -small colimits. Invoking the implication (1) \Rightarrow (2), we see that U is left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. Applying the universal property of Kan extensions (Corollary 7.3.6.13), we deduce that the functor T is isomorphic to U , and therefore also preserves κ -small colimits. \square

Remark 8.4.3.7. In the statement of Theorem 8.4.3.6, it is not necessary to assume that the ∞ -category \mathcal{D} admits κ -small colimits (though we will primarily be interested in cases where this condition is satisfied).

Example 8.4.3.8. Let \mathcal{C} be a small ∞ -category and let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ spanned by the representable functors. Then a functor of ∞ -categories $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ preserves small colimits if and only if it is left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$.

Proof of Theorem 8.4.3.3. Let κ be an uncountable regular cardinal and let \mathcal{C} be an ∞ -category which is essentially κ -small. It follows from Example 7.6.7.8 that the ∞ -category $\mathcal{S}^{<\kappa}$ is κ -cocomplete, so that the functor ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is also κ -cocomplete (Remark 7.6.7.5). Let \mathcal{D} be an ∞ -category which admits κ -small colimits. We wish to show that the composite functor

$$\text{Fun}^\kappa(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \rightarrow \text{Fun}(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \xrightarrow{\circ h_\bullet} \text{Fun}(\mathcal{C}, \mathcal{D})$$

is an equivalence of ∞ -categories. Theorem 8.3.3.13 guarantees that the covariant Yoneda embedding $\mathcal{C} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is an equivalence of ∞ -categories. We are therefore reduced to showing that the restriction functor

$$U : \text{Fun}^\kappa(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \rightarrow \text{Fun}(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \quad F \mapsto F|_{\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})}$$

is an equivalence of ∞ -categories. By virtue of Theorem 8.4.3.6, $\text{Fun}^\kappa(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ is the full subcategory of $\text{Fun}(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ spanned by those functors which are left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. Applying Corollary 7.3.6.15, we see that U restricts to a trivial Kan fibration

$$\text{Fun}^\kappa(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}) \rightarrow \text{Fun}'(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D}),$$

where $\text{Fun}'(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ denotes the full subcategory of $\text{Fun}(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}), \mathcal{D})$ spanned by those functors which admit a left Kan extension to $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$.

We will complete the proof by showing that every functor $f : \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{D}$ admits a left Kan extension to $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. Fix an object $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ and let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}}$ be as in the statement of Lemma 8.4.3.5. By virtue of Corollary 7.3.5.8, it will suffice to show the diagram

$$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{f} \mathcal{D}$$

admits a colimit in the ∞ -category \mathcal{D} . Since \mathcal{D} admits κ -small colimits, we are reduced to showing that the ∞ -category $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})_{/\mathcal{F}}$ is essentially κ -small (see Remark 7.6.7.6), which follows from Lemma 8.4.3.5. \square

03WL **Corollary 8.4.3.9.** *Let κ be an uncountable regular cardinal, let \mathcal{C} be an ∞ -category which is essentially κ -small, and let $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ be a covariant Yoneda embedding for \mathcal{C} . Then every object $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ can be realized as the colimit of a diagram*

$$\mathcal{K} \rightarrow \mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}),$$

where \mathcal{K} is a κ -small ∞ -category.

Proof. Let \mathcal{K}' denote the fiber product $\mathcal{C} \times_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}}$. Combining Lemma 8.4.3.5 with Theorem 8.3.3.13, we deduce that \mathcal{K}' is essentially κ -small. We can therefore choose an equivalence of ∞ -categories $e : \mathcal{K} \rightarrow \mathcal{K}'$, where \mathcal{K} is κ -small. Applying Theorem 8.4.3.3, we deduce that \mathcal{F} is a colimit of the composite functor

$$\mathcal{K} \xrightarrow{e} \mathcal{K}' = \mathcal{C} \times_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}} \rightarrow \mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}).$$

\square

8.4.4 Example: Extensions as Adjoints

03WM Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{C} is small and \mathcal{D} admits small colimits. It follows from Theorem 8.4.0.3 that, up to isomorphism, the functor f factors as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where h_{\bullet} denotes a covariant Yoneda embedding for \mathcal{C} and F is a functor which preserves small colimits. The functor F is uniquely determined up to isomorphism: by virtue of Theorem 8.4.3.6, it can be characterized as a left Kan extension of f along h_{\bullet} . Our goal in this section is to show that, if the ∞ -category \mathcal{D} is locally small, then we can give another characterization of the functor F : it is left adjoint to the functor

$$\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad D \mapsto \text{Hom}_{\mathcal{D}}(f(\bullet), D).$$

03WN **Proposition 8.4.4.1.** *Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that \mathcal{C} is essentially small, that \mathcal{D} is cocomplete and locally small, and let*

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S})$$

be covariant Yoneda embeddings for \mathcal{C} and \mathcal{D} , respectively. Let G denote the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}^{\mathcal{D}}} \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}) \xrightarrow{\circ f^{\text{op}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}).$$

Then the functor G admits a left adjoint $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$. Moreover, the composition $F \circ h_{\bullet}^{\mathcal{C}}$ is isomorphic to f .

Corollary 8.4.4.2. *Let \mathcal{C} be an essentially small ∞ -category, let \mathcal{D} be an ∞ -category which 04BF is cocomplete and locally small, and let $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ be a functor. The following conditions are equivalent:*

- (1) *The functor F preserves small colimits.*
- (2) *The functor F admits a right adjoint $G : \mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.*

Proof. Assume that F preserves small colimits; we will show that it admits a right adjoint (the reverse implication follows from Corollary 7.1.3.21). Choose covariant Yoneda embeddings

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}),$$

set $f = F \circ h_{\bullet}^{\mathcal{C}}$, and let G denote the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}^{\mathcal{D}}} \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}) \xrightarrow{\circ f^{\text{op}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}).$$

It follows from Proposition 8.4.4.1 that G admits a left adjoint $F' : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ such that $F' \circ h_{\bullet}^{\mathcal{C}}$ is isomorphic to $f = F \circ h_{\bullet}^{\mathcal{C}}$. Since the functor F' also preserves small colimits (Corollary 7.1.3.21), Theorem 8.4.0.3 implies that it is isomorphic to F . It follows that G is also a right adjoint of F . \square

Corollary 8.4.4.3. *Let \mathcal{C} be an essentially small ∞ -category and let $\mathcal{F} : \text{Fun}(\mathcal{C}, \mathcal{S})^{\text{op}} \rightarrow \mathcal{S}$ 04BG be a functor. The following conditions are equivalent:*

- (1) *The functor \mathcal{F} admits a left adjoint.*
- (2) *The functor \mathcal{F} is representable by an object of $\text{Fun}(\mathcal{C}, \mathcal{S})$.*
- (3) *The functor \mathcal{F} preserves small limits.*

Proof. Since the identity functor $\text{id} : \mathcal{S} \rightarrow \mathcal{S}$ is corepresentable (by the object $\Delta^0 \in \mathcal{S}$), the implication (1) \Rightarrow (2) follows from Corollary 6.2.4.2. The implication (2) \Rightarrow (3) is a special case of Corollary 7.4.5.14, and the implication (3) \Rightarrow (1) follows by applying Corollary 8.4.4.2 to the opposite functor $\mathcal{F}^{\text{op}} : \text{Fun}(\mathcal{C}, \mathcal{S}) \rightarrow \mathcal{S}^{\text{op}}$. \square

Following the convention of Remark 5.4.0.5, we will deduce Proposition 8.4.4.1 from the following more general assertion:

03WP Variant 8.4.4.4. Let κ be an uncountable regular cardinal and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that \mathcal{C} is essentially κ -small, that \mathcal{D} admits κ -small colimits, and that the morphism space $\text{Hom}_{\mathcal{D}}(f(C), D)$ is essentially κ -small for every pair of objects $C \in \mathcal{C}, D \in \mathcal{D}$. Then the functor

$$G : \mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \quad D \mapsto \text{Hom}_{\mathcal{D}}(f(\bullet), D)$$

admits a left adjoint $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{D}$ which preserves κ -small colimits. Moreover, the composite functor $\mathcal{C} \xrightarrow{h_{\bullet}^{\mathcal{C}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{F} \mathcal{D}$ is isomorphic to f .

Proof. We first prove the existence of the functor F . Fix a cardinal λ of exponential cofinality $\geq \kappa$, so that the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ is locally λ -small (see Corollary 5.4.8.8). By virtue of Proposition 6.2.4.1, it will suffice to show that for every functor $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$, the composite functor

$$\mathcal{D} \xrightarrow{G} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{\text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})}(\mathcal{F}, \bullet)} \mathcal{S}^{<\lambda}$$

is corepresentable by an object of \mathcal{D} . Since \mathcal{D} admits κ -small colimits, the collection of functors \mathcal{F} which satisfy this condition is closed under κ -small colimits (Remark 8.3.3.16). Using Corollary 8.4.3.9, we can reduce to the case where the functor \mathcal{F} is representable by an object $C \in \mathcal{C}$. In this case, the object $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ corepresents the evaluation functor $\text{ev}_C : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ (Remark 8.3.1.5). It now follows from the definition of the functor G that the composition $\text{ev}_C \circ G$ is corepresentable by the object $f(C) \in \mathcal{D}$.

Choose functor $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{D}$ and a natural transformation $\epsilon : (F \circ G) \rightarrow \text{id}_{\mathcal{D}}$ which exhibits F as a left adjoint to the functor G . It follows from Corollary 7.1.3.21 that the functor F preserves all colimits which exist in $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$; in particular, it preserves κ -small colimits. We will complete the proof by showing that $F \circ h_{\bullet}^{\mathcal{C}}$ is isomorphic to f .

For every pair of objects $X, Y \in \mathcal{C}$, let $\alpha_{X,Y}$ denote the morphism of Kan complexes

$$h_Y^{\mathcal{C}}(X) = \text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{D}}(f(X), f(Y)) = G(f(Y))(X).$$

By virtue of Corollary 8.3.5.8, we can promote the construction $(X, Y) \mapsto \alpha_{X,Y}$ to a natural transformation of functors $\alpha : h_{\bullet}^{\mathcal{C}} \rightarrow G \circ f$. Let β denote a composition of the natural transformations

$$F \circ h_{\bullet}^{\mathcal{C}} \xrightarrow{F(\alpha)} F \circ G \circ f \xrightarrow{\epsilon} \text{id}_{\mathcal{D}} \circ f = f.$$

We claim that β is an isomorphism in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$. By virtue of Theorem 4.4.4.4, it will suffice to show that β induces an isomorphism $\beta_X : F(h_X^{\mathcal{C}}) \rightarrow f(X)$ for each object $X \in \mathcal{C}$. Fix an object $D \in \mathcal{D}$; we wish to show that precomposition with β_X induces a homotopy equivalence of Kan complexes

$$\beta_{X,D} : \text{Hom}_{\mathcal{D}}(f(X), D) \rightarrow \text{Hom}_{\mathcal{D}}(F(h_X^{\mathcal{C}}), D) \simeq \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})}(h_X^{\mathcal{C}}, G(D))$$

We conclude by observing that $\beta_{X,D}$ is left homotopy inverse to the morphism

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})}(h_X^{\mathcal{C}}, G(D)) \rightarrow G(D)(X) \simeq \mathrm{Hom}_{\mathcal{D}}(f(X), D)$$

given by evaluation at $\mathrm{id}_X \in h_X^{\mathcal{C}}(X)$, which is a homotopy equivalence by virtue of Proposition 8.3.1.3 \square

Example 8.4.4.5 (Functoriality of the Presheaf Construction). Let κ be an uncountable regular cardinal, let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that \mathcal{C} is essentially κ -small and that \mathcal{D} is locally κ -small, and fix covariant Yoneda embeddings

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \quad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}).$$

Let $G : \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$ be given by precomposition with f . Then the functor G admits a left adjoint $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$. Moreover, the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}) \\ f \downarrow & & \downarrow F \\ \mathcal{D} & \xrightarrow{h_{\bullet}^{\mathcal{D}}} & \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa}). \end{array}$$

commutes up to isomorphism. This follows by applying Variant 8.4.4.4 to the composite functor $(h_{\bullet}^{\mathcal{D}} \circ f) : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}^{<\kappa})$.

8.4.5 Adjoining Colimits to ∞ -Categories

Let \mathcal{C} be an essentially small ∞ -category and set $\widehat{\mathcal{C}} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. Theorem 8.4.0.3 asserts that the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a cocompletion of \mathcal{C} : that is, it is freely generated from \mathcal{C} by adjoining colimits of small diagrams. In this section, we consider a variant of this construction, where we adjoint colimits of an arbitrary collection of diagrams (and we drop the assumption that \mathcal{C} is essentially small).

Definition 8.4.5.1. Let \mathbb{K} be a collection of simplicial sets. We say that an ∞ -category \mathcal{C} is \mathbb{K} -cocomplete if it admits \mathbb{K} -indexed colimits, for each $K \in \mathbb{K}$. If \mathcal{C} and \mathcal{D} are \mathbb{K} -cocomplete ∞ -categories, we let $\mathrm{Fun}^{\mathbb{K}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which preserve K -indexed colimits, for each $K \in \mathbb{K}$. We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} if the following conditions are satisfied:

- The ∞ -category $\widehat{\mathcal{C}}$ is \mathbb{K} -cocomplete.

- For every \mathbb{K} -cocomplete ∞ -category \mathcal{D} , precomposition with h induces an equivalence of ∞ -categories $\text{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$.

04BK **Example 8.4.5.2.** Let κ be an uncountable regular cardinal, and let \mathbb{K} denote the collection of all κ -small simplicial sets. Then an ∞ -category \mathcal{C} is \mathbb{K} -cocomplete if and only if it is κ -cocomplete, in the sense of Variant 7.6.7.7. A functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} if and only if it exhibits $\widehat{\mathcal{C}}$ as a κ -cocompletion of \mathcal{C} , in the sense of Definition 8.4.3.2.

In particular, if \mathbb{K} is the collection of all small simplicial sets, then an ∞ -category \mathcal{C} is a \mathbb{K} -cocomplete if and only if it is cocomplete, and a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} if and only if it exhibits $\widehat{\mathcal{C}}$ as a cocompletion of \mathcal{C} .

Our goal in this section is to prove the following existence result:

04BL **Proposition 8.4.5.3.** *Let \mathbb{K} be a collection of simplicial sets and let \mathcal{C} be an ∞ -category. Then there exists an ∞ -category $\widehat{\mathcal{C}}$ and a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} . Moreover, the functor h is dense and fully faithful.*

04BM **Warning 8.4.5.4.** Let \mathbb{K} be a collection of simplicial sets and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} . In general, it is not true that every object of $\widehat{\mathcal{C}}$ can be recovered as the colimit of a diagram

$$K \rightarrow \mathcal{C} \xrightarrow{h} \widehat{\mathcal{C}}$$

for some $K \in \mathbb{K}$.

Let κ be an uncountable regular cardinal. If \mathbb{K} is the collection of all κ -small simplicial sets and the ∞ -category \mathcal{C} is essentially κ -small, then Proposition 8.4.5.3 follows from Theorem 8.4.3.3; in this case, we can take $\widehat{\mathcal{C}}$ to be the ∞ -category of functors $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. To prove Proposition 8.4.5.3 in general, we will build on this special case.

04BN **Construction 8.4.5.5.** Let \mathbb{K} be a collection of simplicial sets and let \mathcal{C} be an ∞ -category. Choose an uncountable regular cardinal κ such that \mathcal{C} is locally κ -small and every simplicial set $K \in \mathbb{K}$ is essentially κ -small. We let $\widehat{\mathcal{C}}$ denote the smallest full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ which contains all representable functors and is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$. Note that covariant Yoneda embedding for \mathcal{C} determines a functor $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, which is dense (by virtue of Variant 8.4.2.4 and Remark 8.4.1.19) and fully faithful (by virtue of Theorem 8.3.3.13).

04BP **Remark 8.4.5.6.** In the situation of Construction 8.4.5.5, the ∞ -category $\widehat{\mathcal{C}}$ is independent of the choice of κ (provided that κ is chosen large enough that \mathcal{C} is locally κ -small and each $K \in \mathbb{K}$ is essentially κ -small).

Proposition 8.4.5.3 is an immediate consequence of the following more precise result:

Proposition 8.4.5.7. *Let \mathbb{K} be a collection of simplicial sets, let \mathcal{C} be an ∞ -category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.5. Then the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} .*

The proof of Proposition 8.4.5.7 will require some preliminaries.

Lemma 8.4.5.8. *Let \mathbb{K} be a collection of simplicial sets, let \mathcal{C} be an ∞ -category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.5. Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{D} is \mathbb{K} -cocomplete. Then there exists a functor $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ and an isomorphism $f \rightarrow F|_c$, where the functor F is left Kan extended from the essential image of the Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$. Moreover, the functor F preserves K -indexed colimits, for each $K \in \mathbb{K}$.*

Proof. Fix an uncountable regular cardinal κ such that \mathcal{C} is essentially κ -small and each $K \in \mathbb{K}$ is essentially κ -small. By virtue of Corollary 8.3.3.17, we may assume without loss of generality that \mathcal{D} is a replete full subcategory of a κ -cocomplete ∞ -category \mathcal{D}' , and that the inclusion map $\mathcal{D} \hookrightarrow \mathcal{D}'$ preserves all κ -small colimits which exist in \mathcal{D} . By virtue of Theorem 8.4.3.3, we can also assume that f factors as a composition

$$\mathcal{C} \xrightarrow{h_\bullet} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \xrightarrow{F'} \mathcal{D}',$$

where F' preserves κ -small colimits. The full subcategory $F'^{-1}(\mathcal{D}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ contains all representable functors and is closed under K -indexed colimits for each $K \in \mathbb{K}$, and therefore contains $\widehat{\mathcal{C}}$. It follows that F' restricts to a functor $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ which preserves K -indexed colimits for each $K \in \mathbb{K}$. Theorem 8.4.3.6 implies that F' is left Kan extended from the full subcategory $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$, so the functor $F = F'|_{\widehat{\mathcal{C}}}$ has the same property. \square

Lemma 8.4.5.9. *Let \mathbb{K} be a collection of simplicial sets, let \mathcal{C} be an ∞ -category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.5. Let \mathcal{D} be a \mathbb{K} -cocomplete ∞ -category and let $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ be a functor. The following conditions are equivalent:*

- (1) *The functor F is left Kan extended from the essential image of the Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$.*
- (2) *The functor F preserves K -indexed colimits, for each $K \in \mathbb{K}$.*

Proof. Let F_0 denote the restriction of F to the essential image of h_\bullet . Applying Lemma 8.4.5.8, we deduce that F_0 admits a left Kan extension $F' : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ which preserves K -indexed colimits for each $K \in \mathbb{K}$. Invoking the universal property of Kan extensions (Corollary 7.3.6.9), we see that there is an essentially unique natural transformation $\alpha : F' \rightarrow F$ which restricts to the identity transformation from F_0 to itself. We can then reformulate condition (1) as follows:

- (1') The natural transformation α is an isomorphism. That is, for each object $X \in \widehat{\mathcal{C}}$, the induced map $\alpha_X : F'(X) \rightarrow F(X)$ is an isomorphism in the ∞ -category \mathcal{D} .

The implication $(1') \Rightarrow (2)$ follows from the fact that F' preserves K -indexed colimits for each $K \in \mathbb{K}$. To prove the converse, let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ denote the full subcategory spanned by those objects X for which α_X is an isomorphism in the ∞ -category \mathcal{D} . By construction, $\widehat{\mathcal{C}}'$ contains all representable functors $\mathcal{C}^{\text{op}} \rightarrow \mathcal{S}^{<\kappa}$. If condition (2) is satisfied, then $\widehat{\mathcal{C}}'$ is closed under the formation of K -indexed colimits for each $K \in \mathbb{K}$, and therefore coincides with $\widehat{\mathcal{C}}$. \square

Proof of Proposition 8.4.5.7. Let \mathbb{K} be a collection of simplicial sets, let \mathcal{C} be an ∞ -category, and let $\widehat{\mathcal{C}}$ be as in Construction 8.4.5.5. By construction, the ∞ -category $\widehat{\mathcal{C}}$ is \mathbb{K} -cocomplete. To complete the proof, we must show that if \mathcal{D} is any \mathbb{K} -cocomplete ∞ -category, then composition with the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ induces an equivalence of ∞ -categories $\theta : \text{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$.

Let $\mathcal{C}' \subseteq \widehat{\mathcal{C}}$ be the essential image of h_{\bullet} , so that θ factors as a composition

$$\text{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\theta'} \text{Fun}(\mathcal{C}', \mathcal{D}) \xrightarrow{\theta''} \text{Fun}(\mathcal{C}, \mathcal{D})$$

where θ'' is an equivalence of ∞ -categories (Theorem 8.3.3.13). Using Lemma 8.4.5.9, we see that $\text{Fun}^{\mathbb{K}}(\widehat{\mathcal{C}}, \mathcal{D})$ is the full subcategory of $\text{Fun}(\widehat{\mathcal{C}}, \mathcal{D})$ spanned by those functors which are left Kan extended from \mathcal{C}' . It follows from Corollary 7.3.6.15 that θ' is a trivial Kan fibration onto a full subcategory of $\text{Fun}(\mathcal{C}', \mathcal{D})$; in particular, it is fully faithful, so that θ is fully faithful. Lemma 8.4.5.8 implies that θ is essentially surjective, and therefore an equivalence of ∞ -categories (Theorem 4.6.2.19). \square

04BT **Remark 8.4.5.10.** The \mathcal{K} -cocompletion construction of this section has been studied in more detail by Rezk; we refer the reader to [47] for more details.

8.4.6 Recognition of Cocompletions

03WR Let \mathcal{C} be an essentially small ∞ -category, let $\widehat{\mathcal{C}}$ denote the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a covariant Yoneda embedding for \mathcal{C} . Then:

- (1) The functor h is fully faithful (Theorem 8.3.3.13).
- (2) For each object $X \in \mathcal{C}$, the functor

$$\text{Hom}_{\widehat{\mathcal{C}}}(h(X), \bullet) : \widehat{\mathcal{C}} \rightarrow \mathcal{S}$$

preserves small colimits (see Example 8.4.6.2 below).

- (3) The ∞ -category $\widehat{\mathcal{C}}$ is generated (under small colimits) by the essential image of h (in fact, the functor h is dense: see Theorem 8.4.2.1).

Our goal in this section is to prove the converse: if $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ is *any* functor which satisfies conditions (1) through (3), then h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of \mathcal{C} (Proposition 8.4.6.6) and is therefore equivalent to the covariant Yoneda embedding of \mathcal{C} . First, let us introduce a bit of terminology.

Definition 8.4.6.1. Let \mathcal{D} be a locally small ∞ -category which admits small colimits. We say that an object $X \in \mathcal{D}$ is *atomic* if the corepresentable functor

$$h^X : \mathcal{D} \rightarrow \mathcal{S} \quad Y \mapsto \mathrm{Hom}_{\mathcal{D}}(X, Y)$$

preserves small colimits.

Example 8.4.6.2 (Representable Functors are Atomic). Let \mathcal{C} be an essentially small ∞ -category. Then every representable functor $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$ is atomic when regarded as an object of the ∞ -category $\widehat{\mathcal{C}} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. To see this, suppose that \mathcal{F} is representable by an object $C \in \mathcal{C}$. Using Remark 8.3.1.5, we see that \mathcal{F} corepresents the evaluation functor

$$\mathrm{ev}_C : \widehat{\mathcal{C}} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{S} \quad \mathcal{G} \mapsto \mathcal{G}(C),$$

and therefore preserves small colimits by virtue of Proposition 7.1.6.1.

Definition 8.4.6.3. Let $\widehat{\mathcal{C}}$ be an ∞ -category. We say that a full subcategory $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ is *weakly dense* if the following condition is satisfied:

- Let $f : Y \rightarrow Z$ be a morphism of $\widehat{\mathcal{C}}$ such that, for every object $X \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\widehat{\mathcal{C}}}(X, Y) \xrightarrow{[f] \circ} \mathrm{Hom}_{\widehat{\mathcal{C}}}(X, Z)$$

is a homotopy equivalence of Kan complexes. Then f is an isomorphism.

We say that a collection of objects $\{X_i\}_{i \in I}$ of $\widehat{\mathcal{C}}$ is *weakly dense* if it spans a weakly dense full subcategory of $\widehat{\mathcal{C}}$.

Remark 8.4.6.4. Let $\widehat{\mathcal{C}}$ be a locally small ∞ -category. A full subcategory $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ is weakly dense if and only if the restricted Yoneda embedding $\widehat{\mathcal{C}} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is conservative.

Example 8.4.6.5. Let $\widehat{\mathcal{C}}$ be an ∞ -category and let $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ be a full subcategory which generates $\widehat{\mathcal{C}}$ under colimits (see Warning 8.4.1.10). Then the full subcategory \mathcal{C} is weakly dense. In particular, every dense subcategory of $\widehat{\mathcal{C}}$ is weakly dense.

Proposition 8.4.6.6. Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{C} is essentially small. Then f exhibits \mathcal{D} as a cocompletion of \mathcal{C} (in the sense of Definition 8.4.0.1) if and only if the following conditions are satisfied:

- (0) *The ∞ -category \mathcal{D} is locally small and cocomplete.*
- (1) *The functor f is fully faithful.*
- (2) *For each object $C \in \mathcal{C}$, the image $f(C) \in \mathcal{D}$ is atomic.*
- (3) *The collection of objects $\{f(C)\}_{C \in \mathcal{C}}$ is weakly dense in \mathcal{D} .*

03WY **Corollary 8.4.6.7.** *Let \mathcal{D} be an ∞ -category. The following conditions are equivalent:*

- (a) *There exists an essentially small ∞ -category \mathcal{C} and a functor $h : \mathcal{C} \rightarrow \mathcal{D}$ which exhibits \mathcal{D} as a cocompletion of \mathcal{C} .*
- (b) *The ∞ -category \mathcal{D} is locally small and cocomplete. Moreover, it contains a small collection of atomic objects $\{X_i\}_{i \in I}$ which is weakly dense.*

Proof. We first show that (a) implies (b). Without loss of generality, we may assume that $\mathcal{D} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, where \mathcal{C} is a small ∞ -category. Since the ∞ -category \mathcal{S} is cocomplete (Corollary 7.4.5.6), the ∞ -category \mathcal{D} is also cocomplete (Remark 7.6.7.5). Corollary 5.4.8.9 guarantees that \mathcal{D} is locally small. For each object $X \in \mathcal{C}$, let $h_X \in \mathcal{D}$ be a functor represented by X . The collection of objects $\{h_X\}_{X \in \mathcal{C}}$ span a full subcategory of \mathcal{D} which is dense (Corollary 8.4.2.2), and therefore weakly dense (Example 8.4.6.5). We conclude by observing that each of the representable functors h_X is a atomic object of \mathcal{D} (Example 8.4.6.2).

We now show that (b) implies (a). Assume that \mathcal{D} is locally small and cocomplete. Let $\{X_i\}_{i \in I}$ be a small collection of atomic objects of \mathcal{D} , and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be the full subcategory that they span. It follows from Proposition 5.4.8.7 that the ∞ -category \mathcal{D}_0 is essentially small. If \mathcal{D}_0 is weakly dense in \mathcal{D} , then the inclusion map $\mathcal{D}_0 \hookrightarrow \mathcal{D}$ satisfies the hypotheses of Proposition 8.4.6.6, and therefore exhibits \mathcal{D} as a cocompletion of \mathcal{D}_0 . \square

Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where \mathcal{C} is essentially small and \mathcal{D} is cocomplete. Using Theorem 8.4.0.3, we see that f admits an essentially unique factorization as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where the functor F preserves small colimits. As a first step towards the proof of Proposition 8.4.6.6, we study conditions which guarantee that F is fully faithful. With an eye towards future applications, we consider a slightly more general situation.

03X1 **Lemma 8.4.6.8.** *Let \mathbb{K} be a collection of simplicial sets, let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} , and let $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ a functor which satisfies the following conditions:*

- (0) *The ∞ -category \mathcal{D} is \mathbb{K} -cocomplete and the functor F preserves K -indexed colimits, for each $K \in \mathbb{K}$.*
- (1) *The functor $f = F \circ h$ is fully faithful.*
- (2) *Let κ be an uncountable regular cardinal such that \mathcal{D} is locally κ -small and each $K \in \mathbb{K}$ is essentially κ -small. Then, for each $C \in \mathcal{C}$, the corepresentable functor*

$$\mathcal{D} \rightarrow \mathcal{S}^{<\kappa} \quad D \mapsto \text{Hom}_{\mathcal{D}}(f(C), D)$$

preserves K -indexed colimits, for each $K \in \mathbb{K}$.

Then F is fully faithful.

Proof. By virtue of Proposition 8.4.5.7, we may assume without loss of generality that $\widehat{\mathcal{C}}$ is the smallest replete full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ which contains all representable functors and is closed under the formation of K -indexed colimits for $K \in \mathbb{K}$ (see Construction 8.4.5.5). For every pair of objects $\mathcal{G}, \mathcal{G}' \in \widehat{\mathcal{C}}$, the functor F induces a morphism of Kan complexes

$$\theta_{\mathcal{G}, \mathcal{G}'} : \text{Hom}_{\widehat{\mathcal{C}}}(\mathcal{G}, \mathcal{G}') \rightarrow \text{Hom}_{\mathcal{D}}(F(\mathcal{G}), F(\mathcal{G}')).$$

By virtue of Corollary 8.3.5.8 (and Remark 8.3.5.9), we can promote the construction $(\mathcal{G}, \mathcal{G}') \mapsto \theta_{\mathcal{G}, \mathcal{G}'}$ to a functor of ∞ -categories

$$\theta : \widehat{\mathcal{C}}^{\text{op}} \times \widehat{\mathcal{C}} \rightarrow \text{Fun}(\Delta^1, \mathcal{S}^{<\kappa}).$$

We wish to show that, for every pair of objects $\mathcal{G}, \mathcal{G}' \in \widehat{\mathcal{C}}$, the morphism $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence. Let us first regard the functor \mathcal{G}' as fixed. Let $\widehat{\mathcal{C}}'$ denote the full subcategory of $\widehat{\mathcal{C}}$ spanned by those objects \mathcal{G} for which $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence. For each $K \in \mathbb{K}$, our assumption that F preserves K -indexed colimits guarantees that the functor $\mathcal{G} \mapsto \theta_{\mathcal{G}, \mathcal{G}'}$ preserves K^{op} -indexed limits (Proposition 7.4.5.13). Consequently, the full subcategory $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ is closed under the formation of K -indexed colimits. It will therefore suffice to show that $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence in the special case where $\mathcal{G} = h_C$ is the functor represented by some object $C \in \mathcal{C}$.

Let us now regard $\mathcal{G} = h_C$ as fixed. Combining Example 8.4.6.2 with assumption (2), we deduce that the functor

$$\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa}) \rightarrow \text{Fun}(\Delta^1, \mathcal{S}^{<\lambda}) \quad \mathcal{G}' \mapsto \theta_{\mathcal{G}, \mathcal{G}'}$$

preserves K -indexed colimits, for each $K \in \mathbb{K}$. Invoking Corollary 8.4.3.9 again, we are reduced to proving that $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence in the special case where $\mathcal{G}' = h_{C'}$

for some object $C' \in \mathcal{C}$. In this case, we have a commutative diagram of Kan complexes

$$\begin{array}{ccc} & \text{Hom}_{\mathcal{C}}(C, C') & \\ & \swarrow & \searrow \\ \text{Hom}_{\widehat{\mathcal{C}}}(\mathcal{G}, \mathcal{G}') & \xrightarrow{\theta_{\mathcal{G}, \mathcal{G}'}} & \text{Hom}_{\mathcal{D}}(F(\mathcal{G}), F(\mathcal{G}')), \end{array}$$

where the left vertical map is a homotopy equivalence by virtue of Yoneda's lemma (Theorem 8.3.3.13) and the right vertical map is a homotopy equivalence by virtue of assumption (1). It follows that lower horizontal map is also a homotopy equivalence. \square

Proof of Proposition 8.4.6.6. Let \mathcal{C} be an essentially small ∞ -category, let \mathcal{D} be a cocomplete ∞ -category, and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. By virtue of Theorem 8.4.0.3, the functor f admits an essentially unique factorization as a composition

$$\mathcal{C} \xrightarrow{h_\bullet} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where h_\bullet is the covariant Yoneda embedding for \mathcal{C} and the functor F preserves small colimits. Moreover, f exhibits \mathcal{D} as a cocompletion of \mathcal{C} if and only if the functor F is an equivalence of ∞ -categories. If this condition is satisfied, then \mathcal{D} is locally small (Corollary 5.4.8.9), the functor f is fully faithful (Theorem 8.3.3.13), the essential image of f consists of atomic objects of \mathcal{D} (Example 8.4.6.2). We may therefore assume without loss of generality that f satisfies conditions (0), (1), and (2) of Proposition 8.4.6.6, so that F is fully faithful (Lemma 8.4.6.8). Using Proposition 8.4.4.1, we see that the functor F admits a right adjoint $G : \mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, given on objects by the formula $G(D)(C) = \text{Hom}_{\mathcal{D}}(f(C), D)$. By virtue of Corollary 6.3.3.14, the functor F is an equivalence if and only if the functor G is conservative: that is, if and only if the collection of objects $\{f(C)\}_{C \in \mathcal{C}}$ is weakly dense. \square

Proposition 8.4.6.6 has a counterpart for more general cocompletions:

03WZ **Variant 8.4.6.9.** Let \mathbb{K} be a collection of simplicial sets and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then f exhibits \mathcal{D} as a \mathbb{K} -cocompletion of \mathcal{C} (in the sense of Definition 8.4.5.1) if and only if the following conditions are satisfied:

- (0) The ∞ -category \mathcal{D} is \mathbb{K} -cocomplete.
- (1) The functor f is fully faithful.
- (2) Let κ be an uncountable regular cardinal such that \mathcal{D} is locally κ -small and each $K \in \mathbb{K}$ is essentially κ -small. Then, for each $C \in \mathcal{C}$, the corepresentable functor

$$\mathcal{D} \rightarrow \mathcal{S}^{<\kappa} \quad D \mapsto \text{Hom}_{\mathcal{D}}(f(C), D)$$

preserves K -indexed colimits, for each $K \in \mathbb{K}$.

- (3) The ∞ -category \mathcal{D} is generated by the objects $\{f(C)\}_{C \in \mathcal{C}}$ under the formation of K -indexed colimits for $K \in \mathbb{K}$.

Proof. Let κ be as in (2), and let $\widehat{\mathcal{C}} \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ denote the smallest replete full subcategory which contains all representable functors and is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$ (see Construction 8.4.5.5). By virtue of Proposition 8.4.5.7, the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} . Assume that \mathcal{D} is \mathbb{K} -complete, so that f factors (up to isomorphism) as a composition $\mathcal{C} \xrightarrow{h_{\bullet}} \widehat{\mathcal{C}} \xrightarrow{F} \mathcal{D}$, where the functor F preserves K -indexed colimits for each $K \in \mathbb{K}$. To complete the proof, it will suffice to show that if f satisfies conditions (1), (2), and (3), then the functor F is an equivalence of ∞ -categories (the reverse implication follows from Theorem 8.3.3.13 and Example 8.4.6.2). Applying Lemma 8.4.6.8, we see that the functor F is fully faithful and therefore restricts to an equivalence of $\widehat{\mathcal{C}}$ with a replete full subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$. For each $K \in \mathbb{K}$, our assumption that F preserves K -indexed colimits guarantees that the subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$ is closed under the formation of K -indexed colimits. Since \mathcal{D}_0 contains the essential image of the functor f , the equality $\mathcal{D}_0 = \mathcal{D}$ follows from assumption (3). \square

8.4.7 Slices of Cocompletions

Let $U : \widetilde{\mathcal{C}} \rightarrow \mathcal{C}$ be a functor between essentially small ∞ -categories. Using Example 04BU 8.4.4.5, we see that U admits an essentially unique extension $\text{Fun}(\widetilde{\mathcal{C}}^{\text{op}}, \mathcal{S}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ which preserves small colimits. Our goal in this section is to show that, up to equivalence, this construction carries right fibrations to right fibrations. More precisely, if U is a right fibration, we show that $\text{Fun}(\widetilde{\mathcal{C}}^{\text{op}}, \mathcal{S})$ is equivalent to the slice ∞ -category $\text{Fun}(\widetilde{\mathcal{C}}^{\text{op}}, \mathcal{S})_{/\mathcal{F}}$, where $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ is a covariant transport representation for the left fibration U^{op} (Corollary 8.4.7.2). This is a consequence of the following:

Proposition 8.4.7.1. *Let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a 04BV cocompletion of \mathcal{C} , let $\mathcal{F} \in \widehat{\mathcal{C}}$ be an object, and let*

$$\begin{array}{ccc} \widetilde{\mathcal{C}} & \xrightarrow{\widetilde{h}} & \widehat{\mathcal{C}}_{/\mathcal{F}} \\ \downarrow & & \downarrow \\ \mathcal{C} & \xrightarrow{h} & \widehat{\mathcal{C}} \end{array}$$

be a categorical pullback square of ∞ -categories. Then \widetilde{h} exhibits $\widehat{\mathcal{C}}_{/\mathcal{F}}$ as a cocompletion of $\widetilde{\mathcal{C}}$.

04BW Corollary 8.4.7.2. *Let $U : \tilde{\mathcal{C}} \rightarrow \mathcal{C}$ be a right fibration between essentially small ∞ -categories and let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ be a covariant transport representation for the left fibration U^{op} . Then there exists an equivalence of ∞ -categories $T : \text{Fun}(\tilde{\mathcal{C}}^{\text{op}}, \mathcal{S}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}}$ for which the diagram of ∞ -categories*

$$\begin{array}{ccc} \tilde{\mathcal{C}} & \xrightarrow{h_{\bullet}^{\tilde{\mathcal{C}}}} & \text{Fun}(\tilde{\mathcal{C}}^{\text{op}}, \mathcal{S}) \\ \downarrow U & & \downarrow T \\ & & \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}} \\ \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \end{array}$$

commutes up to isomorphism. Here $h_{\bullet}^{\mathcal{C}}$ and $h_{\bullet}^{\tilde{\mathcal{C}}}$ denote covariant Yoneda embeddings for \mathcal{C} and $\tilde{\mathcal{C}}$, respectively.

Proof. Using Corollary 8.4.2.7, we can choose categorical pullback square

$$\begin{array}{ccc} \tilde{\mathcal{C}} & \xrightarrow{\tilde{h}} & \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}} \\ \downarrow U & & \downarrow \\ \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}). \end{array}$$

It follows from Theorem 8.4.0.3 that the functor \tilde{h} factors (up to isomorphism) as a composition

$$\tilde{\mathcal{C}} \xrightarrow{h_{\bullet}^{\tilde{\mathcal{C}}}} \text{Fun}(\tilde{\mathcal{C}}^{\text{op}}, \mathcal{S}) \xrightarrow{T} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}},$$

where the functor T preserves small colimits. To complete the proof, it will suffice to show that T is an equivalence of ∞ -categories. This is equivalent to the assertion that \tilde{h} exhibits $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}}$ as a cocompletion of $\tilde{\mathcal{C}}$, which is a special case of Proposition 8.4.7.1. \square

Proposition 8.4.7.1 is a special case of the following more general assertion:

04BX Proposition 8.4.7.3. *Let \mathbb{K} be a collection of simplicial sets, let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor which exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} , let $f : L \rightarrow \widehat{\mathcal{C}}$ be any morphism of simplicial sets,*

and let

$$\begin{array}{ccc}
 \tilde{\mathcal{C}} & \xrightarrow{\tilde{h}} & \widehat{\mathcal{C}}_{/f} \\
 \downarrow & & \downarrow \\
 \mathcal{C} & \xrightarrow{h} & \widehat{\mathcal{C}}
 \end{array}
 \quad \text{04BY} \quad (8.52)$$

be a categorical pullback square of ∞ -categories. Then \tilde{h} exhibits $\widehat{\mathcal{C}}_{/f}$ as a \mathbb{K} -cocompletion of $\tilde{\mathcal{C}}$.

Proof. We will show that \tilde{h} satisfies the hypotheses of Variant 8.4.6.9:

- (0) The ∞ -category $\widehat{\mathcal{C}}_{/f}$ is \mathbb{K} -cocomplete: that is, it admits K -indexed colimits, for each $K \in \mathbb{K}$. This follows from Corollary 7.1.3.20, since the ∞ -category $\widehat{\mathcal{C}}$ is \mathbb{K} -cocomplete.
- (1) The functor \tilde{h} is fully faithful. This is a special case of Remark 4.6.2.7, since the diagram (8.52) is a categorical pullback square and the functor h is fully faithful.
- (2) Choose an uncountable regular cardinal κ such that $\widehat{\mathcal{C}}$ and $\widehat{\mathcal{C}}_{/f}$ are locally κ -small, and each simplicial set $K \in \mathbb{K}$ is essentially κ -small. Choose an object $\tilde{C} \in \tilde{\mathcal{C}}$ having image $C \in \mathcal{C}$, and let

$$\mathcal{F} : \widehat{\mathcal{C}} \rightarrow \mathcal{S}^{<\kappa} \quad \widetilde{\mathcal{F}} : \widehat{\mathcal{C}}_{/f} \rightarrow \mathcal{S}^{<\kappa}$$

be functors corepresented by the objects $X = h(C)$ and $\tilde{X} = \tilde{h}(\tilde{C})$, respectively. For every simplicial set $K \in \mathbb{K}$, the functor \mathcal{F} preserves K -indexed colimits, and we must show $\widetilde{\mathcal{F}}$ has the same property. Choose a colimit diagram $\tilde{g} : K^\triangleright \rightarrow \widehat{\mathcal{C}}_{/f}$; we wish to show that $\widetilde{\mathcal{F}} \circ \tilde{g}$ is a colimit diagram in the ∞ -category $\mathcal{S}^{<\kappa}$. Let $g : K^\triangleright \rightarrow \widehat{\mathcal{C}}$ denote the composition of \tilde{g} with the projection map. Then g is a colimit diagram in $\widehat{\mathcal{C}}$ (Corollary 7.1.3.20), so $\mathcal{F} \circ g$ is a colimit diagram in the ∞ -category $\mathcal{S}^{<\kappa}$. Define

$$\mathcal{E} = K^\triangleright \times_{\widehat{\mathcal{C}}} \widehat{\mathcal{C}}_{X/} \quad \widetilde{\mathcal{E}} = K^\triangleright \times_{\widehat{\mathcal{C}}} \widehat{\mathcal{C}}_{X/}.$$

Using Proposition 5.7.6.21, we see that $\mathcal{F} \circ g$ and $\widetilde{\mathcal{F}} \circ \tilde{g}$ are covariant transport representations for the left fibrations $\mathcal{E} \rightarrow K^\triangleleft$ and $\widetilde{\mathcal{E}} \rightarrow K^\triangleleft$, respectively. Our assumption that $\mathcal{F} \circ g$ is a colimit diagram guarantees that the inclusion map $K \times_{K^\triangleleft} \mathcal{E} \hookrightarrow \mathcal{E}$ is left cofinal, and we wish to show that the inclusion map $K \times_{K^\triangleleft} \widetilde{\mathcal{E}} \hookrightarrow \widetilde{\mathcal{E}}$ is also left cofinal (Corollary 7.4.5.12). This follows from Proposition 7.2.3.13, since the tautological map $\widetilde{\mathcal{E}} \rightarrow \mathcal{E}$ is a pullback of the projection map $(\widehat{\mathcal{C}}_{X/})_{/f} \rightarrow \widehat{\mathcal{C}}_{X/}$, and therefore a right fibration (Proposition 4.3.6.1).

- (3) Let $\widehat{\mathcal{C}}'_{/f}$ denote the smallest replete full subcategory of $\widehat{\mathcal{C}}_{/f}$ which contains the essential image of \tilde{h} and is closed under the formation of K -indexed colimits for $K \in \mathbb{K}$. We

wish to show that $\widehat{\mathcal{C}}'_{/f} = \widehat{\mathcal{C}}_{/f}$. Let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ denote the full subcategory spanned by those objects $X \in \widehat{\mathcal{C}}$ having the property that every object $\tilde{X} \in \widehat{\mathcal{C}}_{/f}$ lying over X belongs to $\widehat{\mathcal{C}}^0_{/f}$. We will complete the proof by showing that $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$. Since the diagram (8.52) is a categorical pullback square, $\widehat{\mathcal{C}}'$ contains the essential image of the functor h . It will therefore suffice to show that $\widehat{\mathcal{C}}'$ is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$. Fix a colimit diagram $g : K^\triangleright \rightarrow \widehat{\mathcal{C}}$ carrying the cone point of K^\triangleright to an object $X \in \widehat{\mathcal{C}}$. Assume that $g|_K$ factors through $\widehat{\mathcal{C}}'$; we wish to show that X also belongs to $\widehat{\mathcal{C}}'$. Let \tilde{X} be an object of $\widehat{\mathcal{C}}_{/f}$ lying over X . Since the inclusion of the cone point into K^\triangleright is right anodyne (Example 4.3.7.11), we can lift g to a diagram $\tilde{g} : K^\triangleright \rightarrow \widehat{\mathcal{C}}_{/f}$ carrying the cone point to \tilde{X} (Proposition 4.2.4.5). The assumption that $g|_K$ factors through $\widehat{\mathcal{C}}'$ guarantees that $\tilde{g}|_K$ factors through $\widehat{\mathcal{C}}^0_{/f}$. Since g is a colimit diagram, \tilde{g} is also a colimit diagram (Corollary 7.1.3.20). It follows that \tilde{X} belongs to $\widehat{\mathcal{C}}'_{/f}$. Allowing the object \tilde{X} to vary, we conclude that X belongs to $\widehat{\mathcal{C}}'$, as desired.

□

8.5 Retracts and Idempotents

03Y9 Let \mathcal{C} be a category containing an object X . Recall that an object $Y \in \mathcal{C}$ is a *retract* of X if there exist morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ satisfying $\text{id}_Y = r \circ i$, so that we have a commutative diagram

03YA

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array} \tag{8.53}$$

In this case, we will refer to (8.53) as a *retraction diagram in \mathcal{C}* .

04BZ **Remark 8.5.0.1.** Let X and Y be objects of a category \mathcal{C} . Then a retraction diagram (8.53) can be viewed as a morphism from id_X to id_Y in the twisted arrow category $\text{Tw}(\mathcal{C})$ of Construction 8.1.0.1. In particular, Y is a retract of X if and only if there exists a morphism $\text{id}_X \rightarrow \text{id}_Y$ in $\text{Tw}(\mathcal{C})$.

There is a universal example of a retraction diagram:

03YB **Construction 8.5.0.2.** We define a category Ret as follows:

- The category Ret has exactly two objects, which we denote by \tilde{X} and \tilde{Y} .

- The morphisms sets in Ret are given by

$$\text{Hom}_{\text{Ret}}(\tilde{X}, \tilde{X}) = \{\text{id}_{\tilde{X}}, \tilde{e}\} \quad \text{Hom}_{\text{Ret}}(\tilde{X}, \tilde{Y}) = \{\tilde{r}\}$$

$$\text{Hom}_{\text{Ret}}(\tilde{Y}, \tilde{X}) = \{\tilde{i}\} \quad \text{Hom}_{\text{Ret}}(\tilde{Y}, \tilde{Y}) = \{\text{id}_{\tilde{Y}}\}.$$

- The composition law in Ret is given (on non-identity morphisms) by the formulae

$$\tilde{r} \circ \tilde{i} = \text{id}_{\tilde{Y}} \quad \tilde{i} \circ \tilde{r} = \tilde{e}$$

$$\tilde{e} \circ \tilde{i} = \tilde{i} \quad \tilde{e} \circ \tilde{e} = \tilde{e} \quad \tilde{r} \circ \tilde{e} = \tilde{r}.$$

Exercise 8.5.0.3. Let \mathcal{C} be a category containing a retraction diagram

03YC

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array}$$

Show that there is a unique functor $F : \text{Ret} \rightarrow \mathcal{C}$ which is given on objects by $F(\tilde{X}) = X$ and $F(\tilde{Y}) = Y$, and also satisfies $F(\tilde{i}) = i$ and $F(\tilde{r}) = r$. We therefore obtain a bijection

$$\{\text{Functors } \text{Ret} \rightarrow \mathcal{C}\} \xrightarrow{\sim} \{\text{Retraction diagrams in } \mathcal{C}\}.$$

In particular, an object $Y \in \mathcal{C}$ is a retract of another object $X \in \mathcal{C}$ if and only if there exists a functor $F : \text{Ret} \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{Y}) = Y$.

Our first goal in this section is to extend the theory of retracts to the setting of higher category theory. Here there are (at least) two ways that we might choose to proceed:

- Let \mathcal{C} be an ∞ -category containing an object X . We could define an object $Y \in \mathcal{C}$ to be a retract of X if there exist morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ such that the identity morphism id_Y is a composition of r with i , in the sense of Definition 1.3.4.1.
- Let \mathcal{C} be an ∞ -category containing an object X . We could define an object $Y \in \mathcal{C}$ to be a retract of X if there exists a functor of ∞ -categories $F : N_{\bullet}(\text{Ret}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{Y}) = Y$.

In §8.5.1, we show that these definitions are equivalent. Note that objects $X, Y \in \mathcal{C}$ satisfy condition (a) if and only if there exists a 2-simplex σ of \mathcal{C} whose boundary is indicated in

the diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y; \end{array}$$

in this case, we will say that σ is a *retraction diagram in \mathcal{C}* (Definition 8.5.1.16). We will establish the equivalence of (a) and (b) by showing that every retraction diagram in \mathcal{C} can be extended to a functor $F : \mathrm{N}_\bullet(\mathrm{Ret}) \rightarrow \mathcal{C}$ (Corollary 8.5.1.24). In contrast with Exercise 8.5.0.3, the functor F is not necessarily unique; however, it is uniquely determined up to isomorphism (in fact, up to a contractible space of choices).

Our second goal in this section is to address the following:

03YD **Question 8.5.0.4.** Given an ∞ -category \mathcal{C} and an object $X \in \mathcal{C}$, how can one classify the retracts of X ?

In §8.5.2, we recall the answer to Question 8.5.0.4 in the situation where \mathcal{C} is an ordinary category. We say that a endomorphism $e : X \rightarrow X$ is *idempotent* if it satisfies the identity $e \circ e = e$ (Definition 8.5.2.1). Every retraction diagram

03YE

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array} \tag{8.54}$$

determines an idempotent endomorphism of X , given by the composition $e = i \circ r$ (Example 8.5.2.3). We say that an idempotent endomorphism is *split* if it can be obtained in this way (Example 8.5.2.3). In this case, we can recover the retraction diagram (8.54) up to (unique) isomorphism from e ; for example the object Y can be recovered as the equalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ (see Corollary 8.5.2.5 and its proof). We therefore obtain a bijection

$$\{\text{Split idempotent endomorphisms of } X\} \simeq \{\text{Diagrams (8.54)}\}/\text{Isomorphism}.$$

We can therefore reformulate Question 8.5.0.4 as follows:

03YF **Question 8.5.0.5.** What is the correct ∞ -categorical counterpart of the notion of an idempotent endomorphism?

In §8.5.3, we propose an answer to Question 8.5.0.5. Let Idem denote the full subcategory of Ret spanned by the object \tilde{X} (Construction 8.5.2.7). We define an *idempotent* in \mathcal{C} to be a functor of ∞ -categories $F : \text{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ (Definition 8.5.3.1). Every retraction diagram in \mathcal{C} can be extended to a functor $\overline{F} : \text{N}_\bullet(\text{Ret}) \rightarrow \mathcal{C}$, which we can restrict to obtain an idempotent $F : \text{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$. We will say that an idempotent in \mathcal{C} is *split* if it can be obtained in this way. In this case, we will show that \overline{F} can be recovered from the idempotent F up to isomorphism (Corollary 8.5.3.10). Consequently, we obtain a bijection

$$\{\text{Split idempotents in } \mathcal{C}\}/\text{Isomorphism} \simeq \{\text{Retraction diagrams in } \mathcal{C}\}/\text{Isomorphism}.$$

To fully address Question 8.5.0.4, we also need to provide a criterion to determine when an idempotent splits. Here we have several closely related results:

- If \mathcal{C} is (the nerve of) an ordinary category, then an idempotent endomorphism $e : X \rightarrow X$ is split if and only if the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ admits an equalizer (or a coequalizer); see Corollary 8.5.2.5. If this condition is satisfied, then the (co)equalizer is the associated retract of X .
- If \mathcal{C} is an ∞ -category, then an idempotent $F : \text{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ is split if and only if it admits a limit (or a colimit); see Corollary 8.5.3.11. If this condition is satisfied, then the (co)limit is the associated retract of $X = F(\tilde{X})$.
- Let \mathcal{C} be an ∞ -category and let $F : \text{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent, carrying the morphism $\tilde{e} : \tilde{X} \rightarrow \tilde{X}$ of Idem to a morphism $e : X \rightarrow X$ of \mathcal{C} . Then F is split if and only if the sequential diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

admits a limit (or a colimit); see Proposition 8.5.4.16. If this condition is satisfied, then the (co)limit is the associated retract of X .

In §8.5.4, we study ∞ -categories \mathcal{C} in which every idempotent is split; if this condition is satisfied, we say that \mathcal{C} is *idempotent complete* (Definition 8.5.4.1). Many ∞ -categories which arise in practice are idempotent complete. For example, an ∞ -category which admits sequential limits or colimits is automatically idempotent complete (Corollary 8.5.4.17). In §8.5.5, we show that every ∞ -category \mathcal{C} admits an *idempotent completion* $\widehat{\mathcal{C}}$ which is characterized (up to equivalence) by the existence of a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ having the following properties:

- The ∞ -category $\widehat{\mathcal{C}}$ is idempotent complete.
- The functor H is fully faithful.

- Every object of $\widehat{\mathcal{C}}$ is a retract of $H(X)$, for some object $X \in \mathcal{C}$.

Moreover, the idempotent completion $\widehat{\mathcal{C}}$ can be characterized by a universal mapping property: for every idempotent complete ∞ -category \mathcal{D} , composition with H induces an equivalence of ∞ -categories $\text{Fun}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$ (see Proposition 8.5.5.2).

Let \mathcal{C} be an ∞ -category, let X be an object of \mathcal{C} , and let $e : X \rightarrow X$ be an endomorphism of X . We will say that e is *idempotent* if there exists a functor $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{e}) = e$. If \mathcal{C} is (the nerve of) an ordinary category, then the functor F is completely determined by the pair (X, e) . In general, this need not be true: the simplicial set $N_\bullet(\text{Idem})$ contains a nondegenerate simplex of every dimension (Remark 8.5.3.3), so the specification of F requires an infinite quantity of data. Nevertheless, we prove in §8.5.6 that F is determined by the pair (X, e) up to (canonical) isomorphism (Corollary 8.5.6.5). This motivates the following:

03YG **Question 8.5.0.6.** Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . How can one determine if e is idempotent?

Let us first record a necessary condition. We say that an endomorphism $e : X \rightarrow X$ is *homotopy idempotent* if the homotopy class $[e]$ is an idempotent endomorphism in the homotopy category $h\mathcal{C}$ (Definition 8.5.7.1). It follows immediately from the definitions that every idempotent endomorphism in \mathcal{C} is homotopy idempotent. In §8.5.7, we show that the converse is false in general (Proposition 8.5.7.15), though it is true in some important special cases (see Corollary 8.5.7.6 and Exercise 8.5.7.8).

For every integer $n \geq 0$, let $N_{\leq n}(\text{Idem})$ denote the n -skeleton of the simplicial set $N_\bullet(\text{Idem})$ (Variant 1.2.1.5). Note that an endomorphism $e : X \rightarrow X$ in \mathcal{C} can be identified with a diagram $F : N_{\leq 1}(\text{Idem}) \rightarrow \mathcal{C}$ (Example 8.5.8.2), and that e is homotopy idempotent if and only if F admits an extension to $N_{\leq 2}(\text{Idem})$ (Example 8.5.8.3). In §8.5.8, we address Question 8.5.0.6 by showing that e is idempotent if and only if F admits an extension to $N_{\leq 3}(\text{Idem})$ (Corollary 8.5.8.8). As an application, we show that the construction $\mathcal{C} \mapsto \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$ commutes with filtered colimits, up to equivalence (Corollary 8.5.8.9).

8.5.1 Retracts in ∞ -Categories

03YH The notion of retract has an obvious counterpart in the setting of ∞ -categories.

03YJ **Definition 8.5.1.1.** Let \mathcal{C} be an ∞ -category containing an object X . We say that an object $Y \in \mathcal{C}$ is a *retract* of X if there exist morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ for which the identity morphism id_Y is a composition of i and r , in the sense of Definition 1.3.4.1.

03YK **Remark 8.5.1.2.** Let \mathcal{C} be an ∞ -category containing an object X . Then an object $Y \in \mathcal{C}$ is a retract of X (in the sense of Definition 8.5.1.1) if and only if it is a retract of X when viewed as an object of the homotopy category $h\mathcal{C}$.

Remark 8.5.1.3. Let \mathcal{C} be a category containing an object X . Then an object $Y \in \mathcal{C}$ is 03YL retract of X if and only if it is a retract of X when viewed as an object of the ∞ -category $N_{\bullet}(\mathcal{C})$ (in the sense of Definition 8.5.1.1). Consequently, Definition 8.5.1.1 can be viewed as a generalization of the classical notion of retract.

Example 8.5.1.4. Let \mathcal{C} be an ∞ -category containing an object X . If an object $Y \in \mathcal{C}$ is 03YM isomorphic to X , then Y is a retract of X . In particular, the object X is a retract of itself.

Remark 8.5.1.5 (Transitivity). Let \mathcal{C} be an ∞ -category containing objects X , Y , and Z . 03YN If Y is a retract of X and Z is a retract of Y , then Z is a retract of X . To prove this, it suffices to establish the analogous result for the homotopy category $h\mathcal{C}$ (Remark 8.5.1.2), which follows immediately from Remark 8.5.0.1.

In practice, many important properties of an object X of an ∞ -category \mathcal{C} are inherited by any retract of X . We record a few examples of this phenomenon which will be useful later.

Proposition 8.5.1.6 (Retracts of Isomorphisms). *Let \mathcal{C} be an ∞ -category containing 03YP morphisms $f : X \rightarrow X'$ and $g : Y \rightarrow Y'$. Suppose that g is a retract of f (when regarded as objects of the arrow ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$). If f is an isomorphism, then g is also an isomorphism.*

Proof. By virtue of Remark 8.5.1.2, we may assume that \mathcal{C} is (the nerve of) an ordinary category. Choose a commutative diagram

$$\begin{array}{ccccc} Y & \xrightarrow{i} & X & \xrightarrow{r} & Y \\ \downarrow g & & \downarrow f & & \downarrow g \\ Y' & \xrightarrow{i'} & X' & \xrightarrow{r'} & Y', \end{array}$$

where the horizontal compositions are the identity morphisms id_Y and $\text{id}_{Y'}$, respectively. If f is an isomorphism, then g is also an isomorphism, with inverse given by the composition $Y' \xrightarrow{i'} X' \xrightarrow{f^{-1}} X \xrightarrow{r} Y$. This follows from the calculations

$$\begin{aligned} g \circ r \circ f^{-1} \circ i' &= r' \circ f \circ f^{-1} \circ i' = r' \circ \text{id}_{X'} \circ i' = r' \circ i' = \text{id}_{Y'} \\ r \circ f^{-1} \circ i' \circ g &= r \circ f^{-1} \circ f \circ i = r \circ \text{id}_X \circ i = r \circ i = \text{id}_Y. \end{aligned}$$

□

Proposition 8.5.1.7. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full 03YQ subcategory. Suppose that every object $Y \in \mathcal{C}$ is a retract of some object $X \in \mathcal{C}^0$. Then F is left and right Kan extended from \mathcal{C}^0 .*

Proof. We will show that F is left Kan extended from \mathcal{C}^0 ; the assertion that F is right Kan extended from \mathcal{C}^0 follows by a similar argument. Choose a regular cardinal κ for which \mathcal{C} is essentially κ -small. Using Corollary 8.3.3.17, we can choose a fully faithful functor $\mathcal{D} \rightarrow \widehat{\mathcal{D}}$, where $\widehat{\mathcal{D}}$ admits κ -small colimits. By virtue of Remark 7.3.1.13, we can replace \mathcal{D} by $\widehat{\mathcal{D}}$ and thereby reduce to proving Proposition 8.5.1.7 in the special case where \mathcal{D} admits κ -small colimits.

Set $F^0 = F|_{\mathcal{C}^0}$. Using Proposition 7.6.7.13, we can extend F^0 to a functor $F' : \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from \mathcal{C}^0 . Invoking the universal mapping property of Corollary 7.3.6.9, we deduce that there is a natural transformation $\alpha : F' \rightarrow F$ which restricts to the identity transformation from F^0 to itself. The natural transformation α carries each object $Y \in \mathcal{C}$ to a morphism $\alpha_Y : F'(Y) \rightarrow F(Y)$ in the ∞ -category \mathcal{D} . By assumption, the object Y is a retract of some object $X \in \mathcal{C}^0$. It follows that α_Y is a retract of the morphism $\alpha_X = \text{id}_{F(X)}$, and is therefore an isomorphism (Proposition 8.5.1.6). Invoking Theorem 4.4.4.4, we deduce that the natural transformation α is an isomorphism, so that F is left Kan extended from \mathcal{C}^0 by virtue of Remark 7.3.3.16. \square

Proposition 8.5.1.7 immediately implies the following stronger version of Proposition 7.3.3.7:

03YR **Corollary 8.5.1.8.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that F is U -left Kan extended from \mathcal{C}^0 at an object $X \in \mathcal{C}$. If $Y \in \mathcal{C}$ is a retract of X , then F is also U -left Kan extended from \mathcal{C}^0 at Y .*

Proof. Without loss of generality, we may assume that \mathcal{C} is spanned by \mathcal{C}^0 together with the objects X and Y . By virtue of Proposition 7.3.8.6, we can further assume that \mathcal{C}^0 contains the object X . In this case, Proposition 8.5.1.7 implies that the functors F and $U \circ F$ are left Kan extended from \mathcal{C}^0 , so that F is U -left Kan extended from \mathcal{C}^0 by virtue of Remark 7.3.3.19. \square

03YS **Corollary 8.5.1.9.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. Suppose that F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then any functor $G : \mathcal{C} \rightarrow \mathcal{D}$ which is a retract of F (in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$) is also U -left Kan extended from \mathcal{C}^0 .*

Proof. Let $\text{ev} : \mathcal{C} \times \text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{D}$ denote the evaluation functor. By virtue of Remark 7.3.3.3, the functor F is U -left Kan extended from \mathcal{C}^0 at an object $C \in \mathcal{C}$ if and only if the functor ev is U -left Kan extended from $\mathcal{C}^0 \times \text{Fun}(\mathcal{C}, \mathcal{D})$ at the object (C, F) . If this condition is satisfied, then Corollary 8.5.1.8 guarantees that ev is also U -left Kan extended from $\mathcal{C}^0 \times \text{Fun}(\mathcal{C}, \mathcal{D})$ at the object (C, G) , so that G is U -left Kan extended from \mathcal{C}^0 at C . The desired result now follows by allowing the object $C \in \mathcal{C}$ to vary. \square

Corollary 8.5.1.10. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, let K be a simplicial set, 03YT and suppose we are given a pair of diagrams $f, g : K^\triangleright \rightarrow \mathcal{D}$. If f is a U -colimit diagram and g is a retract of f (in the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{D})$), then g is also a U -colimit diagram.*

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $K \hookrightarrow \mathcal{K}$, where \mathcal{K} is an ∞ -category. Using Remark 4.3.6.7, we see that the induced map $K^\triangleright \hookrightarrow \mathcal{K}^\triangleright$ is also inner anodyne. We may therefore extend f and g to functors $F, G : \mathcal{K}^\triangleright \rightarrow \mathcal{D}$. Since the restriction functor $\text{Fun}(\mathcal{K}^\triangleright, \mathcal{D}) \rightarrow \text{Fun}(K^\triangleright, \mathcal{D})$ is a trivial Kan fibration (Proposition 1.4.7.6), it follows that G is a retract of F . By virtue of Corollary 7.2.2.2, we can replace K by \mathcal{K} and thereby reduce to proving Corollary 8.5.1.10 in the special case where K is an ∞ -category. In this case, the desired result is a special case of Corollary 8.5.1.9 (see Example 7.3.3.9). \square

Corollary 8.5.1.11. *Let K be a simplicial set and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which preserves K -indexed colimits. If $G : \mathcal{C} \rightarrow \mathcal{D}$ is a retract of F (in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$), then G also preserves K -indexed colimits.* 03YU

Proposition 8.5.1.12. *Let \mathcal{X} and \mathcal{Y} be ∞ -categories and let κ be an uncountable cardinal. Suppose that \mathcal{Y} is a retract of \mathcal{X} in the ∞ -category \mathcal{QC} . If \mathcal{X} is essentially κ -small, then \mathcal{Y} is also essentially κ -small.* 03YV

Proof. By virtue of Proposition 5.4.6.12, we may assume that the ∞ -categories \mathcal{X} and \mathcal{Y} are minimal, so that \mathcal{X} is a κ -small simplicial set (Corollary 5.4.6.9). Choose functors $i : \mathcal{Y} \rightarrow \mathcal{X}$ and $r : \mathcal{X} \rightarrow \mathcal{Y}$ such that the composition $(r \circ i) : \mathcal{Y} \rightarrow \mathcal{Y}$ is isomorphic to the identity functor. Then $r \circ i$ is an equivalence of ∞ -categories. Since \mathcal{Y} is minimal, it follows that $r \circ i$ is an isomorphism of simplicial sets (Proposition 5.4.6.10). In particular, the functor $i : \mathcal{Y} \rightarrow \mathcal{X}$ is a monomorphism of simplicial sets. It follows that \mathcal{Y} is κ -small (Remark 5.4.4.8), and therefore essentially κ -small. \square

Remark 8.5.1.13. *In the situation of Proposition 8.5.1.12, suppose that the ∞ -category \mathcal{X} is a Kan complex. Then \mathcal{Y} is also a Kan complex, and is therefore a retract of X in the homotopy category hKan . To prove this, it will suffice to show that every morphism $f : Y \rightarrow Y'$ in the ∞ -category \mathcal{Y} is an isomorphism (Proposition 4.4.2.1). Since \mathcal{X} is a Kan complex, the morphism $i(f) : i(Y) \rightarrow i(Y')$ is an isomorphism in \mathcal{X} (Proposition 1.3.6.10). It follows that $(r \circ i)(f)$ is an isomorphism in \mathcal{Y} (Remark 1.4.1.6). Since f is isomorphic to $(r \circ i)(f)$ (as an object of the ∞ -category $\text{Fun}(\Delta^1, \mathcal{Y})$), it is also an isomorphism (Example 4.4.1.13).* 03YW

Corollary 8.5.1.14. *Let X and Y be Kan complexes and let κ be an uncountable cardinal. Suppose that Y is a retract of X in the ∞ -category \mathcal{S} . If X is essentially κ -small, then Y is essentially κ -small.* 03YX

03YY **Warning 8.5.1.15.** In the statement of Corollary 8.5.1.14, the uncountability assumption on κ cannot be omitted. That is, if X is a Kan complex for which there exists a weak homotopy equivalence $K \rightarrow X$ for a *finite* simplicial set K , then a retract of X need not inherit the same property. See §[?].

We now make Definition 8.5.1.1 slightly more explicit.

03YZ **Definition 8.5.1.16.** Let \mathcal{C} be an ∞ -category. A *retraction diagram* in \mathcal{C} is a 2-simplex $\sigma : \Delta^2 \rightarrow \mathcal{C}$ for which the “long” face $d_1(\sigma)$ is an identity morphism of \mathcal{C} . In this case, we indicate σ by a diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y, \end{array}$$

in the ∞ -category \mathcal{C} , and we say that σ *exhibits* Y as a retract of X .

03Z0 **Remark 8.5.1.17.** Let \mathcal{C} be an ∞ -category containing an object X . Then an object $Y \in \mathcal{C}$ is a retract of X (in the sense of Definition 8.5.1.1) if and only if there exists a retraction diagram which exhibits Y as a retract of X (in the sense of Definition 8.5.1.16).

03Z1 **Warning 8.5.1.18.** If \mathcal{C} is (the nerve of) an ordinary category, then a retraction diagram in \mathcal{C} can be identified with a pair of morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ satisfying the condition $r \circ i = \text{id}_Y$. Beware that, if \mathcal{C} is a general ∞ -category, then a retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array}$$

generally cannot be recovered (even up to isomorphism) from the morphisms i and r alone: one also needs a homotopy which witnesses the identity $[r] \circ [i] = [\text{id}_Y]$ in the homotopy category $\text{h}\mathcal{C}$.

03Z2 **Remark 8.5.1.19.** Let \mathcal{C} be an ∞ -category. A 2-simplex σ of \mathcal{C} is a retraction diagram if and only if it is a retraction diagram when viewed as an object of the opposite ∞ -category \mathcal{C}^{op} . Consequently, if X and Y are objects of \mathcal{C} , then Y is a retract of X in \mathcal{C} if and only if it is a retract of X in the ∞ -category \mathcal{C}^{op} .

Our goal in this section is carry out an ∞ -categorical analogue of Exercise 8.5.0.3.

Notation 8.5.1.20. Let Ret denote the category introduced in Construction 8.5.0.2. By construction, the ∞ -category $N_\bullet(\text{Ret})$ contains a retraction diagram $\sigma : \Delta^2 \rightarrow N_\bullet(\text{Ret})$, which we depict as

$$\begin{array}{ccc} & \tilde{X} & \\ \tilde{i} \nearrow & \nearrow \tilde{r} & \\ \tilde{Y} & \xrightarrow{\text{id}} & \tilde{Y}. \end{array}$$

We let \mathcal{R} denote the image of σ , which we regard as a simplicial subset of $N_\bullet(\text{Ret})$.

Remark 8.5.1.21. In the situation of Notation 8.5.1.20, the map $\sigma : \Delta^2 \rightarrow \mathcal{R}$ is an epimorphism of simplicial sets, which fits into a pushout square

$$\begin{array}{ccc} N_\bullet(\{0 < 2\}) & \longrightarrow & \Delta^0 \\ \downarrow & & \downarrow \\ \Delta^2 & \xrightarrow{\sigma} & \mathcal{R}. \end{array}$$

It follows that, for every ∞ -category \mathcal{C} , composition with σ induces a bijection from $\text{Hom}_{\text{Set}_\Delta}(\mathcal{R}, \mathcal{C})$ to the set of retraction diagrams in \mathcal{C} (in the sense of Definition 8.5.1.16).

Remark 8.5.1.22. Let $\sigma : \Delta^2 \rightarrow \mathcal{R}$ be the epimorphism of Notation 8.5.1.20. For every ∞ -category \mathcal{C} , precomposition with σ induces a fully faithful functor $\text{Fun}(\mathcal{R}, \mathcal{C}) \hookrightarrow \text{Fun}(\Delta^2, \mathcal{C})$, whose essential image is the full subcategory $\text{Fun}'(\Delta^2, \mathcal{C}) \subseteq \text{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams

$$\begin{array}{ccc} & X & \\ i \nearrow & \nearrow r & \\ Y & \xrightarrow{u} & Y' \end{array}$$

where u is an isomorphism. This follows by applying Corollary 4.5.2.24 to the pullback square

$$\begin{array}{ccc} \text{Fun}(\mathcal{R}, \mathcal{C}) & \longrightarrow & \text{Fun}'(\Delta^2, \mathcal{C}) \\ \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \text{Isom}(\mathcal{C}), \end{array}$$

since the vertical maps are isofibrations (Corollary 4.4.5.3) and the lower horizontal map is an equivalence of ∞ -categories by virtue of Corollary 4.5.3.13.

Our main result can now be stated as follows:

03Z6 **Proposition 8.5.1.23.** *The inclusion map $\mathcal{R} \hookrightarrow N_\bullet(\text{Ret})$ is an inner anodyne morphism of simplicial sets.*

03Z7 **Corollary 8.5.1.24.** *Let \mathcal{C} be an ∞ -category. Then composition with the inclusion map $\mathcal{R} \hookrightarrow N_\bullet(\text{Ret})$ induces a trivial Kan fibration*

$$\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(\mathcal{R}, \mathcal{C}) \simeq \text{Fun}(\Delta^2, \mathcal{C}) \times_{\text{Fun}(N_\bullet(\{0<2\}), \mathcal{C})} \mathcal{C}.$$

In particular, every retraction diagram in \mathcal{C} can be extended to a functor $N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$, which is uniquely determined up to isomorphism.

Proof. Combine Propositions 8.5.1.23 and 1.4.7.6. □

03Z8 **Remark 8.5.1.25.** Exercise 8.5.0.3 is an immediate consequence of Proposition 8.5.1.23 (see Variant 1.4.6.8).

03Z9 **Corollary 8.5.1.26.** *Let \mathcal{C} be an ∞ -category. Then composition with the retraction diagram of Notation 8.5.1.20 induces a fully faithful functor $\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(\Delta^2, \mathcal{C})$, whose essential image is spanned by those diagrams*

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{u} & Y' \end{array}$$

where u is an isomorphism.

Proof. Combine Corollary 8.5.1.24 with Remark 8.5.1.22. □

03ZA **Corollary 8.5.1.27.** *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category \mathcal{I} . Suppose that each \mathcal{C}_i is an ∞ -category. Then the tautological map*

$$\theta : \varinjlim_{i \in \mathcal{I}} \text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}_i) \rightarrow \text{Fun}(N_\bullet(\text{Ret}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i)$$

is an equivalence of ∞ -categories.

Proof. The morphism θ fits into a commutative diagram

$$\begin{array}{ccc} \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(N_\bullet(\mathrm{Ret}), \mathcal{C}_i) & \xrightarrow{\theta} & \mathrm{Fun}(N_\bullet(\mathrm{Ret}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i) \\ \downarrow & & \downarrow \\ \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathcal{R}, \mathcal{C}_i) & \xrightarrow{\theta'} & \mathrm{Fun}(\mathcal{R}, \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i), \end{array}$$

where the vertical maps are trivial Kan fibrations (Corollary 8.5.1.26). It will therefore suffice to show that θ' is an equivalence of ∞ -categories. In fact, θ' is an isomorphism of simplicial sets, since the simplicial set \mathcal{R} is finite (Corollary 3.5.1.10). \square

The proof of Proposition 8.5.1.23 will require the following:

Lemma 8.5.1.28 (Sparse Horns). *Let $n \geq 0$ be an integer and let S be a subset of 03ZB $[n] = \{0 < 1 < \dots < n\}$. Let $K \subseteq \Delta^n$ be the simplicial subset spanned by those nondegenerate simplices which do not contain every element of S . Suppose that there exist $0 \leq i < j < k \leq n$ such that $i, k \in S$, $j \notin S$. Then the inclusion $K \hookrightarrow \Delta^n$ is inner anodyne.*

Example 8.5.1.29. In the situation of Lemma 8.5.1.28, suppose that $S = [n] \setminus \{j\}$ for some 03ZC $0 \leq j \leq n$. Then K is the horn $\Lambda_j^n \subseteq \Delta^n$. The hypothesis of Lemma 8.5.1.28 guarantees that K is an inner horn, so that the inclusion map $K \hookrightarrow \Delta^n$ is inner anodyne by definition.

Proof of Lemma 8.5.1.28. Let P denote the collection of all subsets $S' \subseteq [n]$ which contain $S \cup \{j\}$. Choose a linear ordering

$$\{S(1) \leq \dots \leq S(c)\}$$

of P with the property that if $S(a) \subseteq S(b)$, then $a \leq b$. Let For $0 \leq b \leq c$, let $K(b) \subseteq \Delta^n$ denote the union of K with the faces $\{N_\bullet(S(a)) \subseteq \Delta^n\}_{1 \leq a \leq b}$. We then have inclusion maps

$$K = K(0) \subseteq K(1) \subseteq K(2) \subseteq \dots \subseteq K(c-1) \subseteq K(c) = \Delta^n.$$

It will therefore suffice to show that, for every positive integer $b \leq c$, the inclusion map $K(b-1) \hookrightarrow K(b)$ is inner anodyne.

Let us identify $N_\bullet(S(b))$ with the image of a nondegenerate simplex $\sigma : \Delta^m \hookrightarrow \Delta^n$. Let $L \subseteq \Delta^m$ be the inverse image $\sigma^{-1}(S(b-1))$, so that we have a pushout diagram of simplicial sets

$$\begin{array}{ccc} L & \longrightarrow & \Delta^m \\ \downarrow & & \downarrow \sigma \\ S(b-1) & \longrightarrow & S(b). \end{array}$$

It will therefore suffice to show that the inclusion map $L \subseteq \Delta^m$ is inner anodyne. Because $S(b)$ contains the integers $i < j < k$, we can write $j = \sigma(\bar{j})$ for some $0 < \bar{j} < n$. We conclude by observing that L can be identified with the inner horn $\Lambda_{\bar{j}}^m \subseteq \Delta^m$. \square

Proof of Proposition 8.5.1.23. Let τ be a nondegenerate m -simplex of the simplicial set $N_\bullet(\text{Ret})$. We define the *weight* $w(\tau)$ to be the cardinality of the set $\{i \in [m] : \tau(i) = \tilde{X}\}$. Note that, if τ' is any nondegenerate facet of τ , then $w(\tau') \leq w(\tau)$. For $n \geq 1$, the collection of nondegenerate simplices of weight $\leq n$ span a simplicial subset $\mathcal{R}(n) \subseteq N_\bullet(\text{Ret})$. It follows that we can write $N_\bullet(\text{Ret})$ as the union of an increasing sequence

$$\mathcal{R}(1) \hookrightarrow \mathcal{R}(2) \hookrightarrow \mathcal{R}(3) \hookrightarrow \dots,$$

where $\mathcal{R}(1)$ coincides with the simplicial set \mathcal{R} introduced in Notation 8.5.1.20. We will complete the proof by showing that, for each $n \geq 2$, the inclusion map $\mathcal{R}(n-1) \hookrightarrow \mathcal{R}(n)$ is inner anodyne.

Let $\sigma_n : \Delta^{2n} \rightarrow N_\bullet(\text{Ret})$ denote the simplex corresponding to the diagram

$$\tilde{Y} \xrightarrow{\tilde{i}} \tilde{X} \xrightarrow{\tilde{r}} \tilde{Y} \xrightarrow{\tilde{i}} \tilde{X} \rightarrow \dots \rightarrow \tilde{X} \xrightarrow{\tilde{r}} \tilde{Y} \xrightarrow{\tilde{i}} \tilde{X} \xrightarrow{\tilde{r}} \tilde{Y}.$$

Note that σ_n is a nondegenerate simplex of weight n , and therefore factors through $\mathcal{R}(n)$. Let $K \subseteq \Delta^{2n}$ denote the inverse image $\sigma_n^{-1}\mathcal{R}(n-1)$, so that we have a commutative diagram of simplicial sets

03ZD

$$\begin{array}{ccc} K & \longrightarrow & \Delta^{2n} \\ \downarrow & & \downarrow \sigma_n \\ \mathcal{R}(n-1) & \longrightarrow & \mathcal{R}(n). \end{array} \tag{8.55}$$

Note that a nondegenerate simplex of Δ^{2n} belongs to K if and only if it does not contain $N_\bullet(\{1 < 3 < \dots < 2n-1\}) \subseteq \Delta^{2n}$. Applying Lemma 8.5.1.28, we deduce that the inclusion map $K \hookrightarrow \Delta^{2n}$ is inner anodyne. It will therefore suffice to show that the diagram (8.55) is a pushout square.

Let τ be an m -simplex of $N_\bullet(\text{Ret})$ which belongs to $\mathcal{R}(n)$, but does not belong to $\mathcal{R}(n-1)$. We wish to show that τ factors uniquely through σ_n . We first prove the existence of the desired factorization. For this, we may assume without loss of generality that τ is nondegenerate. Then τ has weight n , so we can write

$$\{i \in [m] : \tau(i) = X\} = \{d_1 < d_2 < \dots < d_n\}.$$

Let $\alpha : \Delta^m \rightarrow \Delta^{2n}$ be the unique morphism of simplices which is given on vertices by the formula $\alpha(d_i) = 2i - 1$ for $1 \leq i \leq n$. We claim that $\tau = \sigma_n \circ \alpha$. Note that τ and $\sigma_n \circ \alpha$

can both be regarded as functors from the linearly ordered set $[m]$ to the category Ret . By construction, these functors coincide on objects. It will therefore suffice to show that, for $0 \leq j < j' < m$, the functors τ and $\sigma_n \circ \alpha$ determine the same element of $\text{Hom}_{\text{Ret}}(\tau(j), \tau(j'))$. If $\tau(j) = \tilde{Y}$ or $\tau(j') = \tilde{Y}$, this condition is automatic (since the set $\text{Hom}_{\text{Ret}}(\tau(j), \tau(j'))$ has only one element). We may therefore assume without loss of generality that $\tau(j) = \tilde{X} = \tau(j')$: that is, we have $j = d_i$ and $j' = d_{i'}$ for some $i < i'$. In this case, the functors τ and $\sigma_n \circ \alpha$ both carry the pair $(j < j')$ to the element $e \in \text{Hom}_{\text{Ret}}(X, X)$.

We now prove uniqueness. Suppose we are given a pair of maps $\alpha, \beta : \Delta^m \rightarrow \Delta^{2n}$ satisfying $\sigma_n \circ \alpha = \tau = \sigma_n \circ \beta$; we wish to show that $\alpha = \beta$. Suppose otherwise. Then there is some smallest integer $j \in [m]$ such that $\alpha(j) \neq \beta(j)$. Without loss of generality, we may assume that $\alpha(j) < \beta(j)$. Assume first that $\alpha(j)$ is odd. Since τ does not belong to K , $\alpha(j)$ is contained in the image of β ; that is, we can write $\alpha(j) = \beta(i)$ for some $i < j$. Then minimality of j then guarantees that $\alpha(i) = \alpha(j)$, so that $\sigma_n \circ \alpha$ carries the pair $(i < j)$ to the identity morphism $\text{id}_{\tilde{X}}$ in the category Ret . Since $\sigma_n \circ \beta = \tau = \sigma_n \circ \alpha$, the morphism $\sigma_n \circ \beta$ also carries $(i < j)$ to the identity morphism $\text{id}_{\tilde{X}}$. It follows that $\beta(i) = \beta(j)$, contradicting our assumption that $\beta(i) = \alpha(j) < \beta(j)$.

We now treat the case where $\alpha(j)$ is even, so that $\tau(j) = (\sigma_n \circ \alpha)(j) = Y$. Using the equality $\sigma_n \circ \beta = \tau$, we deduce that $\beta(j)$ is also even. Since τ does not belong to K , the odd number $\beta(j) - 1$ belongs to the image of β . We therefore have $\beta(j) - 1 = \beta(i)$ for some integer $i < j$. We then have

$$\alpha(i) \leq \alpha(j) < \alpha(j) + 1 \leq \beta(j) - 1 = \beta(i),$$

contradicting the minimality of j . □

8.5.2 Idempotents in Ordinary Categories

Let M be a monoid. Recall that an element $e \in M$ is *idempotent* if it satisfies the 03ZE equation $e^2 = e$. We now consider the special case where $M = \text{End}_{\mathcal{C}}(X) = \text{Hom}_{\mathcal{C}}(X, X)$ is the set of endomorphisms of an object X of some category \mathcal{C} .

Definition 8.5.2.1. Let \mathcal{C} be a category. An *idempotent endomorphism in \mathcal{C}* is a pair (X, e) , 03ZF where X is an object of \mathcal{C} and $e : X \rightarrow X$ is an endomorphism of X which satisfies the identity $e = e \circ e$, so that we have a commutative diagram

$$\begin{array}{ccc} & X & \\ e \nearrow & & \searrow e \\ X & \xrightarrow{e} & X \end{array}$$

In this situation, we will also say that e is an *idempotent endomorphism of X* .

03ZG **Example 8.5.2.2** (Identity Morphisms). Let \mathcal{C} be a category. For every object $X \in \mathcal{C}$, the identity morphism $\text{id}_X : X \rightarrow X$ is an idempotent endomorphism in \mathcal{C} . Conversely, if $e : X \rightarrow X$ is an idempotent endomorphism in \mathcal{C} which is also an isomorphism, then $e = \text{id}_X$.

03ZH **Example 8.5.2.3** (Split Idempotents). Let \mathcal{C} be a category containing a retraction diagram

03ZJ

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array} \quad (8.56)$$

(see Definition 8.5.1.16). Then $e = i \circ r$ is an idempotent endomorphism of X . This follows from the calculation

$$e \circ e = (i \circ r) \circ (i \circ r) = i \circ \text{id}_Y \circ r = i \circ r = e.$$

We will say that an idempotent endomorphism $e : X \rightarrow X$ is *split* if it can be obtained in this way (that is, if $e = i \circ r$, for some pair of morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ satisfying $r \circ i = \text{id}_Y$).

In the situation of Example 8.5.2.3, the diagram (8.56) can be recovered (up to isomorphism) from the idempotent endomorphism $e : X \rightarrow X$, by virtue of the following:

03ZK **Proposition 8.5.2.4.** *Let \mathcal{C} be a category containing a retraction diagram*

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y, \end{array}$$

and let $e = i \circ r$ be the idempotent endomorphism Example 8.5.2.3. Then:

- (1) *The morphism i exhibits Y as an equalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$.*
- (2) *The morphism r exhibits Y as a coequalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$.*

Proof. We will prove (1); the proof of (2) is similar. Fix an object $Z \in \mathcal{C}$ and a morphism $f : Z \rightarrow X$ satisfying $e \circ f = \text{id}_X \circ f$; we wish to show that there is a unique morphism $g : Z \rightarrow Y$ satisfying $i \circ g = f$. To prove uniqueness, we note that g is determined by the identity

$$g = \text{id}_Y \circ g = (r \circ i) \circ g = r \circ (i \circ g) = r \circ f.$$

To establish existence, we observe that the composition $g = r \circ f$ satisfies the identity

$$i \circ g = i \circ (r \circ f) = (i \circ r) \circ f = e \circ f = \text{id}_X \circ f = f.$$

□

Corollary 8.5.2.5. *Let \mathcal{C} be a category and let $e : X \rightarrow X$ be an idempotent endomorphism 03ZL in \mathcal{C} . The following conditions are equivalent:*

- (1) *The idempotent endomorphism e splits. That is, e admits a factorization $X \xrightarrow{r} Y \xrightarrow{i} X$, where $r \circ i = \text{id}_Y$.*
- (2) *The pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ admits an equalizer in \mathcal{C} .*
- (3) *The pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ admits a coequalizer in \mathcal{C} .*

Proof. The implications (1) \Rightarrow (2) and (1) \Rightarrow (3) follow from Proposition 8.5.2.4. We will show that (2) implies (1); the proof of the implication (3) \Rightarrow (1) is similar. Suppose that there exists a morphism $i : Y \rightarrow X$ which exhibits Y as an equalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$. Since e is idempotent, we have $e \circ e = e = \text{id}_X \circ e$. Invoking the universal property of Y , we deduce that there is a unique morphism $r : X \rightarrow Y$ satisfying $e = i \circ r$. To complete the proof, it will suffice to show that $r \circ i$ is the identity morphism from Y to itself. Since i is a monomorphism, this follows from the calculation

$$i \circ (r \circ i) = (i \circ r) \circ i = e \circ i = \text{id}_X \circ i = i = i \circ \text{id}_Y.$$

□

Corollary 8.5.2.6. *Let \mathcal{C} be a category which admits equalizers (or coequalizers). Then 03ZM every idempotent endomorphism in \mathcal{C} is split.*

Construction 8.5.2.7 (The Universal Idempotent). We define a category Idem as follows: 03ZN

- The category Idem has single object \tilde{X} .
- Morphisms in Idem are given by $\text{Hom}_{\text{Idem}}(\tilde{X}, \tilde{X}) = \{\text{id}_{\tilde{X}}, \tilde{e}\}$.
- The composition law on Idem is given (on non-identity morphisms) by $\tilde{e} \circ \tilde{e} = \tilde{e}$.

Remark 8.5.2.8. Let \mathcal{C} be a category and let $e : X \rightarrow X$ be an idempotent endomorphism 03ZP in \mathcal{C} . Then there is a unique functor $F : \text{Idem} \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{e}) = e$.

Exercise 8.5.2.9. Show that the category Idem is filtered (see Definition 7.2.4.1). 03ZQ

Remark 8.5.2.10. Let Ret denote the category introduced in Construction 8.5.0.2. Then 03ZR Idem can be identified with the full subcategory of Ret spanned by the object \tilde{X} . Let \mathcal{C} be a category and let $\bar{F} : \text{Ret} \rightarrow \mathcal{C}$ be the functor determined by a retraction diagram in \mathcal{C} (see Exercise 8.5.0.3). Then the restriction $F = \bar{F}|_{\text{Idem}}$ corresponds (under the identification of Remark 8.5.2.8) to the idempotent endomorphism of Example 8.5.2.3.

8.5.3 Idempotents in ∞ -Categories

- 03ZS We now consider an ∞ -categorical counterpart of Definition 8.5.2.1.
- 03ZT **Definition 8.5.3.1.** Let \mathcal{C} be an ∞ -category. An *idempotent* in \mathcal{C} is a functor of ∞ -categories $N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$. Here Idem denotes the category introduced in Construction 8.5.2.7.
- 03ZU **Remark 8.5.3.2.** Let \mathcal{C} be a category. It follows from Remark 8.5.2.8 (and Proposition 1.2.2.1) that evaluation on the morphism $\tilde{e} \in \text{Hom}_{\text{Idem}}(\tilde{X}, \tilde{X})$ supplies a bijection from the set of idempotents in the ∞ -category $N_\bullet(\mathcal{C})$ (in the sense of Definition 8.5.3.1) to the set of idempotent endomorphisms (X, e) in the category \mathcal{C} (in the sense of Definition 8.5.2.1). We can therefore view Definition 8.5.3.1 as a generalization of Definition 8.5.2.1.
- 03ZV **Remark 8.5.3.3** (The Structure of $N_\bullet(\text{Idem})$). For every integer $n \geq 0$, the simplicial set $N_\bullet(\text{Idem})$ contains a unique nondegenerate n -simplex σ_n , given by the diagram
- $$\tilde{X} \xrightarrow{\tilde{e}} \tilde{X} \xrightarrow{\tilde{e}} \tilde{X} \xrightarrow{\tilde{e}} \cdots \rightarrow \tilde{X} \xrightarrow{\tilde{e}} \tilde{X}.$$
- Moreover, the face maps of $N_\bullet(\text{Idem})$ satisfy $d_i(\sigma_n) = \sigma_{n-1}$ for $0 \leq i \leq n$. Applying Corollary 3.3.1.8, we obtain an isomorphism of $N_\bullet(\text{Idem})$ with the simplicial set $(\Delta^0)^+$ introduced in Construction 3.3.1.6. Here we abuse notation by identifying Δ^0 with its underlying semisimplicial set.
- 03ZW **Remark 8.5.3.4.** The simplicial set $N_\bullet(\text{Idem})$ is weakly contractible. This is a special case of Lemma 3.4.5.9, applied to the (discrete) category [0].
- 03ZX **Definition 8.5.3.5** (Split Idempotents). Let \mathcal{C} be an ∞ -category and let $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in the ∞ -category \mathcal{C} . A *splitting* of F is a functor $\overline{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ satisfying $\overline{F}|_{N_\bullet(\text{Idem})} = F$. We say that F is *split* if there exists a splitting of F .
- 03ZY **Example 8.5.3.6.** Let \mathcal{C} be a category and let $e : X \rightarrow X$ be an idempotent endomorphism in \mathcal{C} . Then e is split (in the sense of Example 8.5.2.3) if and only if the induced map $N_\bullet(\text{Idem}) \rightarrow N_\bullet(\mathcal{C})$ is a split idempotent in the ∞ -category $N_\bullet(\mathcal{C})$ (in the sense of Definition 8.5.3.5).
- 03ZZ **Remark 8.5.3.7.** Let \mathcal{C} be an ∞ -category and let $F, F' : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be idempotents which are isomorphic (when regarded as objects of the ∞ -category $\text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$). Then F is split if and only if F' is split. See Corollary 4.4.5.3.
- Let \mathcal{C} be an ∞ -category and let $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in \mathcal{C} . If F is split, then the splitting is essentially unique.
- 0400 **Proposition 8.5.3.8.** Let \mathcal{C} be an ∞ -category and let $\overline{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ be a functor. Then \overline{F} is both left and right Kan extended from the full subcategory $N_\bullet(\text{Idem}) \subset N_\bullet(\text{Ret})$.

Proof. This is a special case of Proposition 8.5.1.7. \square

Remark 8.5.3.9. The category Ret of Construction 8.5.0.2 contains an initial object \tilde{Y} . It follows that the inclusion map $\text{Idem} \hookrightarrow \text{Ret}$ has a unique extension $T : \text{Idem}^\triangleleft \rightarrow \text{Ret}$ carrying the cone point of $\text{Idem}^\triangleleft$ to the object \tilde{Y} . Unwinding the definitions, we see that a functor of ∞ -categories $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ is right Kan extended from $N_\bullet(\text{Idem})$ if and only if the composition

$$N_\bullet(\text{Idem})^\triangleleft \xrightarrow{N_\bullet(T)} N_\bullet(\text{Ret}) \xrightarrow{F} \mathcal{C}$$

is a limit diagram. Proposition 8.5.3.8 asserts that this condition is automatically satisfied. In particular, the object $\bar{F}(\tilde{Y})$ is a limit of the underlying diagram $F = \bar{F}|_{N_\bullet(\text{Idem})}$. Similarly, $\bar{F}(\tilde{Y})$ is a colimit of the diagram F .

Corollary 8.5.3.10 (Uniqueness of Splittings). *Let \mathcal{C} be an ∞ -category. Then the restriction functor*

$$\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$$

is fully faithful, and its essential image is the full subcategory consists of the split idempotents in \mathcal{C} .

Proof. Combine Proposition 8.5.3.8 with Corollary 7.3.6.15. \square

Corollary 8.5.3.11. *Let \mathcal{C} be an ∞ -category and let $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in \mathcal{C} . The following conditions are equivalent:*

- (1) *The idempotent F is split: that is, it can be extended to a functor $N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$.*
- (2) *The diagram F admits a limit in \mathcal{C} .*
- (3) *The diagram F admits a colimit in \mathcal{C} .*

Proof. The implications $(1) \Rightarrow (2)$ and $(1) \Rightarrow (3)$ follow from Remark 8.5.3.9, and the reverse implications follow from Corollary 7.3.5.8. \square

Corollary 8.5.3.12. *Let \mathcal{C} be an ∞ -category and let $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in \mathcal{C} . If F admits a limit (or colimit) in \mathcal{C} , then it is preserved by any functor of ∞ -categories $G : \mathcal{C} \rightarrow \mathcal{D}$.*

Proof. Suppose that F admits a limit in \mathcal{C} . Then F splits (Corollary 8.5.3.11): that is, it extends to a diagram $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$. Let $T : \text{Idem}^\triangleleft \rightarrow \text{Ret}$ be as in Remark 8.5.3.9, so that $(\bar{F} \circ N_\bullet(T)) : N_\bullet(\text{Idem})^\triangleleft \rightarrow \mathcal{C}$ is a limit diagram in the ∞ -category \mathcal{C} . We wish to show that the functor $(G \circ \bar{F} \circ N_\bullet(T)) : N_\bullet(\text{Idem})^\triangleleft \rightarrow \mathcal{D}$ is a limit diagram in the ∞ -category \mathcal{D} . By virtue of Proposition 8.5.3.8, this is automatic (Remark 8.5.3.9). \square

8.5.4 Idempotent Completeness

- 0405 We now study ∞ -categories in which every idempotent splits.
- 0406 **Definition 8.5.4.1.** Let \mathcal{C} be an ∞ -category. We say that \mathcal{C} is *idempotent complete* if every idempotent $N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ splits (see Definition 8.5.3.5).
- 0407 **Example 8.5.4.2.** Let \mathcal{C} be a category. If \mathcal{C} admits equalizers (or coequalizers), then the ∞ -category $N_\bullet(\mathcal{C})$ is idempotent complete (this is a restatement of Corollary 8.5.2.6). In particular, if \mathcal{C} admits finite limits or finite colimits, then $N_\bullet(\mathcal{C})$ is idempotent complete.
- 0408 **Warning 8.5.4.3.** An ∞ -category which admits finite limits (or colimits) need not be idempotent complete. See Example [?].
- 0409 **Example 8.5.4.4.** Let X be a Kan complex. Since the simplicial set $N_\bullet(\text{Idem})$ is weakly contractible (Remark 8.5.3.4), every morphism of simplicial sets $N_\bullet(\text{Idem}) \rightarrow X$ is homotopic to a constant map. It follows that X is idempotent complete when viewed as an ∞ -category.
- 040A **Remark 8.5.4.5.** Let \mathcal{C} be an ∞ -category. Then \mathcal{C} is idempotent complete if and only if the opposite ∞ -category \mathcal{C}^{op} is idempotent complete.
- 040B **Proposition 8.5.4.6.** Let \mathcal{C} be an idempotent complete ∞ -category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that, for every object $X \in \mathcal{C}_0$ and every object $Y \in \mathcal{C}$ which is a retract of X , there exists an object $Y' \in \mathcal{C}_0$ which is isomorphic to Y . Then \mathcal{C}_0 is idempotent complete.

Proof. Let Ret denote the category of Construction 8.5.0.2. Suppose we are given an idempotent $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}_0$, carrying the object $\tilde{X} \in \text{Idem}$ to an object $X = F(\tilde{X}) \in \mathcal{C}_0$. We wish to show that F is a split idempotent in \mathcal{C}_0 . Since \mathcal{C} is idempotent complete, we can extend F to a functor $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$, carrying the object $\tilde{Y} \in \text{Ret}$ to an object $Y = \bar{F}(\tilde{Y})$ which is a retract of X . By assumption, we can choose an isomorphism $\alpha_0 : Y \rightarrow Y'$, where Y' belongs to \mathcal{C}_0 . Using Corollary 4.4.5.3, we can lift α_0 to an isomorphism of functors $\alpha : \bar{F} \rightarrow \bar{F}'$ in $\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C})$, whose image in $\text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$ is the identity transformation from F to itself. Then $\bar{F}' : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}_0$ is a splitting of the idempotent F . \square

- 040C **Proposition 8.5.4.7.** Let \mathcal{C} be an ∞ -category. The following conditions are equivalent:

- (1) The ∞ -category \mathcal{C} is idempotent complete.
- (2) The ∞ -category \mathcal{C} admits limits indexed by $N_\bullet(\text{Idem})$.
- (3) The ∞ -category \mathcal{C} admits colimits indexed by $N_\bullet(\text{Idem})$.

Proof. This is an immediate consequence of Corollary 8.5.3.11. \square

Remark 8.5.4.8. Let \mathcal{C} be an ∞ -category. Then \mathcal{C} is idempotent complete if and only if 040D the restriction functor

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \rightarrow \mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C})$$

is an equivalence of ∞ -categories. This is an immediate consequence of Corollary 8.5.3.10.

Corollary 8.5.4.9. Let \mathcal{C} and \mathcal{D} be ∞ -categories which are equivalent. Then \mathcal{C} is idempotent 040E complete if and only if \mathcal{D} is idempotent complete.

Corollary 8.5.4.10. Let \mathcal{C} be an ∞ -category and let K be a simplicial set. If \mathcal{C} is idempotent 040F complete, then $\mathrm{Fun}(K, \mathcal{C})$ is idempotent complete.

Proof. Combine Propositions 8.5.4.7 and 7.1.6.1. \square

Corollary 8.5.4.11. Let \mathcal{C} be an ∞ -category and let $f : K \rightarrow \mathcal{C}$ be a morphism of simplicial 040G sets. If \mathcal{C} is idempotent complete, then the slice and coslice ∞ -categories $\mathcal{C}_{/f}$ and $\mathcal{C}_{f/}$ are idempotent complete.

Proof. Combine Proposition 8.5.4.7 with Corollary 7.1.3.20. \square

To apply the criterion of Proposition 8.5.4.7, it is often useful to replace $\mathrm{N}_\bullet(\mathrm{Idem})$ by a simpler simplicial set.

Notation 8.5.4.12. Let $\mathrm{Spine}[\mathbf{Z}]$ denote the 1-dimensional simplicial set associated to the 040H directed graph

$$\cdots \rightarrow -2 \rightarrow -1 \rightarrow 0 \rightarrow 1 \rightarrow 2 \rightarrow \cdots$$

We let $Q : \mathrm{Spine}[\mathbf{Z}] \rightarrow \mathrm{N}_\bullet(\mathrm{Idem})$ be the morphism of simplicial sets corresponding to the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

in the category Idem .

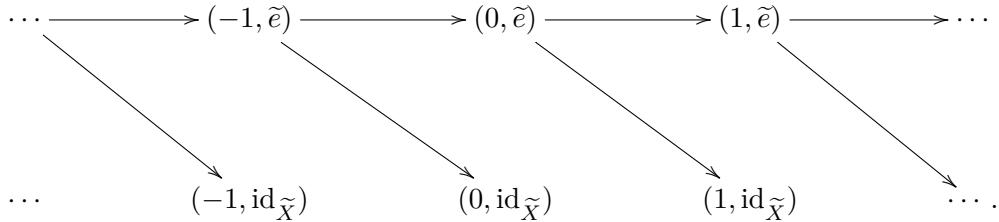

Remark 8.5.4.13. Since the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is 1-dimensional, the morphism Q 040J of Notation 8.5.4.12 factors (uniquely) through the 1-skeleton of $\mathrm{N}_\bullet(\mathrm{Idem})$, which we can identify with the simplicial circle $\Delta^1 / \partial\Delta^1$. Under this identification, Q corresponds to a morphism of simplicial sets $q : \mathrm{Spine}[\mathbf{Z}] \rightarrow \Delta^1 / \partial\Delta^1$. This is a covering map (see Definition 3.1.4.1), which exhibits the simplicial circle $\Delta^1 / \partial\Delta^1$ as the quotient of $\mathrm{Spine}[\mathbf{Z}]$ by a free action of the group $(\mathbf{Z}, +)$ by translations. The induced map of geometric realizations $|\mathrm{Spine}[\mathbf{Z}]| \rightarrow |\Delta^1 / \partial\Delta^1|$ can be identified with the standard covering map $\mathbf{R} \rightarrow S^1$ in the category of topological spaces.

Remark 8.5.4.14. In the situation of Notation 8.5.4.12, we can regard $\mathrm{Spine}[\mathbf{Z}]$ as a 040K simplicial subset of the nerve $\mathrm{N}_\bullet(\mathbf{Z})$, where we regard the set of integers $\mathbf{Z} = \{\cdots < -2 < -1 < 0 < 1 < 2 < \cdots\}$ as equipped with its usual linear ordering. Moreover, the inclusion $\mathrm{Spine}[\mathbf{Z}] \hookrightarrow \mathrm{N}_\bullet(\mathbf{Z})$ is inner anodyne (this is a special case of Proposition 1.4.7.3).

040L **Remark 8.5.4.15.** The simplicial set $\text{Spine}[\mathbf{Z}]$ is weakly contractible. This follows from Remark 8.5.4.14, since the ∞ -category $N_{\bullet}(\mathbf{Z})$ is filtered and therefore weakly contractible (Proposition 7.2.4.9). Alternatively, it can be deduced from Example 3.5.4.4, since the geometric realization $|\text{Spine}[\mathbf{Z}]|$ is homeomorphic to the set of real numbers \mathbf{R} (endowed with its usual topology).

040M **Proposition 8.5.4.16.** *The morphism $Q : \text{Spine}[\mathbf{Z}] \rightarrow N_{\bullet}(\text{Idem})$ of Notation 8.5.4.12 is both left and right cofinal.*

Proof. We will show that Q is left cofinal; a similar argument will show that it is right cofinal. By virtue of Theorem 7.2.3.1, it will suffice to show that the simplicial set $K = \text{Spine}[\mathbf{Z}] \times_{N_{\bullet}(\text{Idem})} N_{\bullet}(\text{Idem})_{/\tilde{X}}$ is weakly contractible. Let us identify the vertices of K with pairs (n, f) , where n is an integer and $f : \tilde{X} \rightarrow \tilde{X}$ is a morphism in the category Idem . Unwinding the definitions, we see that K is the 1-dimensional simplicial set associated to the direct graph given in the diagram

The inclusion of the upper part of the diagram determines a monomorphism of simplicial sets $\text{Spine}[\mathbf{Z}] \hookrightarrow K$ which is left anodyne (since it is a pushout of a coproduct of countably many copies of the inclusion map $\{0\} \hookrightarrow \Delta^1$), and therefore a weak homotopy equivalence (Proposition 3.1.6.14). The desired result now follows from the weak contractibility of the simplicial set $\text{Spine}[\mathbf{Z}]$ (Remark 8.5.4.15). \square

040N **Corollary 8.5.4.17.** *Let \mathcal{C} be an ∞ -category which admits sequential limits (or colimits). Then \mathcal{C} is idempotent complete.*

Proof. It follows from Proposition 8.5.4.16 (and Corollary 7.2.2.12) that the ∞ -category \mathcal{C} admits limits (or colimits) indexed by the ∞ -category $N_{\bullet}(\text{Idem})$, and is therefore idempotent complete by virtue of Proposition 8.5.4.7. \square

040P **Remark 8.5.4.18.** Broadly speaking, Proposition 8.5.4.16 will be useful to us because it shows that the ∞ -category $N_{\bullet}(\text{Idem})$ admits a (left and right) cofinal diagram $Q : K \rightarrow N_{\bullet}(\text{Idem})$, where the simplicial set K is finite-dimensional. Beware that it is not possible to arrange that the simplicial set K is *finite*, since an ∞ -category which admits finite colimits need not be idempotent complete (Warning 8.5.4.3). In particular, there does not exist a categorical equivalence $K \rightarrow N_{\bullet}(\text{Idem})$, where K is a finite simplicial set.

Example 8.5.4.19. Let \mathcal{QC} denote the ∞ -category of (small) ∞ -categories. Then \mathcal{QC} is 040Q idempotent complete. More generally, for every uncountable cardinal κ , the ∞ -category $\mathcal{QC}^{<\kappa}$ of κ -small ∞ -categories is idempotent complete. To prove this, we can use Propositions 8.5.4.6 and 8.5.1.12 to reduce to the case where κ has uncountable cofinality. In this case, the ∞ -category $\mathcal{QC}^{<\kappa}$ admits sequential colimits (Example 7.6.7.8), so the desired result follows from Corollary 8.5.4.17.

Example 8.5.4.20. Let \mathcal{S} denote the ∞ -category of spaces. Then \mathcal{S} is idempotent complete. 040R More generally, for every uncountable cardinal κ , the ∞ -category $\mathcal{S}^{<\kappa}$ of κ -small spaces is idempotent complete. This follows from Example 8.5.4.19 and Proposition 8.5.4.6, since the full subcategory $\mathcal{S}^{<\kappa} \subseteq \mathcal{QC}^{<\kappa}$ is closed under the formation of retracts (Remark 8.5.1.13).

Warning 8.5.4.21. Let \mathcal{C} be an ∞ -category. If \mathcal{C} is idempotent complete, then its homotopy 040S category $h\mathcal{C}$ need not be idempotent complete. For example, the ∞ -category of spaces \mathcal{S} is idempotent complete (Example 8.5.4.20), but its homotopy category $h\mathcal{S} = h\text{Kan}$ is not (see Proposition 8.5.7.15).

8.5.5 Idempotent Completion

Let \mathcal{C} be an ∞ -category. It follows from Corollary 8.3.3.17 (together with the criterion 040T of Proposition 8.5.4.7) that we can choose a fully faithful functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, where $\widehat{\mathcal{C}}$ is idempotent complete. Our goal in this section is to show that there is a canonical choice for the ∞ -category $\widehat{\mathcal{C}}$, which is characterized (up to equivalence) by the requirement that it is as small as possible.

Definition 8.5.5.1. Let \mathcal{C} be an ∞ -category. We say that a functor of ∞ -categories 040U $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as an *idempotent completion* of \mathcal{C} if it satisfies the following conditions:

- (1) The functor H is fully faithful.
- (2) The ∞ -category category $\widehat{\mathcal{C}}$ is idempotent complete.
- (3) For every object $Y \in \widehat{\mathcal{C}}$, there exists an object $X \in \mathcal{C}$ such that Y is a retract of $H(X)$.

We will say that an ∞ -category $\widehat{\mathcal{C}}$ is an *idempotent completion* of \mathcal{C} if there exists a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of \mathcal{C} .

Our first goal is to show that the idempotent completion of an ∞ -category \mathcal{C} is uniquely determined up to equivalence. To prove this, we reformulate Definition 8.5.5.1 as a universal mapping property:

Proposition 8.5.5.2. Let $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories, where $\widehat{\mathcal{C}}$ is idempotent 0411 complete. The following conditions are equivalent:

- (a) *The functor H exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of \mathcal{C} , in the sense of Definition 8.5.5.1.*
- (b) *For every idempotent complete ∞ -category \mathcal{D} , precomposition with H induces an equivalence of ∞ -categories $\mathrm{Fun}(\widehat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\sim} \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.*

Proof. By virtue of Proposition 8.5.4.7, an ∞ -category \mathcal{D} is idempotent complete if and only if it admits $N_\bullet(\mathrm{Idem})$ -indexed colimits: that is, if and only if it is \mathbb{K} -cocomplete, where $\mathbb{K} = \{N_\bullet(\mathrm{Idem})\}$ (see Definition 8.4.5.1). Moreover, every functor of ∞ -categories $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ automatically preserves $N_\bullet(\mathrm{Idem})$ -indexed colimits (Corollary 8.5.3.12). We can therefore restate (b) as follows:

- (b') *The functor H exhibits $\widehat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} , in the sense of Definition 8.4.5.1.*

Using Variant 8.4.6.9, we see that this condition is satisfied if and only if H satisfies conditions (1) and (2) of Definition 8.5.5.1, together with the following variant of (3):

- (3') *The ∞ -category $\widehat{\mathcal{C}}$ is generated by the essential image of H under the formation of $N_\bullet(\mathrm{Idem})$ -indexed colimits. That is, if $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ is a replete full subcategory which contains the essential image of H and is closed under retracts, then $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$.*

The implication (3) \Rightarrow (3') is immediate. To prove the converse, let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ be the full subcategory spanned by those objects Y which are retracts of $H(X)$, for some $X \in \mathcal{C}$. Condition (3) of Definition 8.5.5.1 asserts that $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$. This is a special case of (3'), since $\widehat{\mathcal{C}}'$ is closed under the formation of retracts (Remark 8.5.1.5). \square

040Z **Corollary 8.5.5.3** (Existence). *Let \mathcal{C} be an ∞ -category. Then there exists a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of \mathcal{C} .*

Proof. By virtue of Proposition 8.5.5.2 (and its proof), this is a special case of Proposition 8.4.5.3 \square

Using the Yoneda embedding of §8.3, we can give an explicit construction of idempotent completions. For simplicity, let us assume first that \mathcal{C} is an essentially small ∞ -category. We let $\mathrm{Fun}^{\mathrm{atm}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by those functors $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$ which are *atomic*, in the sense of Definition 8.4.6.1.

040X **Proposition 8.5.5.4.** *Let \mathcal{C} be an essentially small ∞ -category and let $h_\bullet : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding for \mathcal{C} (Definition 8.3.3.9). Then the functor h_\bullet exhibits $\mathrm{Fun}^{\mathrm{atm}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ as an idempotent completion of \mathcal{C} .*

Following the convention of Remark 5.4.0.5, we can regard Proposition 8.3.3.14 as a special case of the following more general assertion (which is essentially a special case of Proposition 8.4.5.7):

Proposition 8.5.5.5. *Let κ be an uncountable regular cardinal, let \mathcal{C} be an ∞ -category which is essentially κ -small, and let $\widehat{\mathcal{C}} \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ be the full subcategory spanned by those functors \mathcal{F} for which the corepresentable functor $\text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})}(\mathcal{F}, \bullet)$ commutes with κ -small colimits. Then the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$ exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of \mathcal{C} .*

Proof. To simplify the notation, set $\mathcal{D} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}^{<\kappa})$. For each object $C \in \mathcal{C}$, the representable functor $h_C \in \mathcal{D}$ corepresents the functor

$$\mathcal{D} \rightarrow \mathcal{S}^{<\kappa} \quad \mathcal{F} \mapsto \mathcal{F}(C)$$

given by evaluation at C , which preserves κ -small colimits by virtue of Proposition 7.1.6.1. It follows that the covariant Yoneda embedding h_{\bullet} factors through the subcategory $\widehat{\mathcal{C}} \subseteq \mathcal{D}$. Moreover, the functor h_{\bullet} is fully faithful (Theorem 8.3.3.13).

The ∞ -category \mathcal{D} admits κ -small colimits, and is therefore idempotent complete by virtue of Proposition 8.5.4.7. It follows from Corollary 8.5.1.11 that the full category $\widehat{\mathcal{C}} \subseteq \mathcal{D}$ is closed under the formation of retracts, and is therefore also idempotent complete (Proposition 8.5.4.6).

To complete the proof, it will suffice to show that every object $\mathcal{F} \in \widehat{\mathcal{C}}$ is a retract of h_C for some object $C \in \mathcal{C}$. Applying Corollary 8.4.3.9, we deduce that \mathcal{F} can be realized as the colimit of a diagram

$$\mathcal{K} \xrightarrow{T} \mathcal{C} \xrightarrow{h_{\bullet}} \mathcal{D},$$

where \mathcal{K} is an essentially κ -small ∞ -category. Since the functor $\text{Hom}_{\mathcal{D}}(\mathcal{F}, \bullet)$ preserves κ -small colimits, it follows that the identity map $\text{id}_{\mathcal{F}} \in \text{Hom}_{\mathcal{D}}(\mathcal{F}, \mathcal{F})$ factors (up to homotopy) through $h_{T(B)}$ for some B . In particular, \mathcal{F} is a retract of the representable functor $h_{T(B)}$. \square

Let \mathcal{C} be an ∞ -category. Proposition 8.5.5.5 supplies an explicit description of its idempotent completion $\widehat{\mathcal{C}}$ which is somewhat transcendental in nature: it locates $\widehat{\mathcal{C}}$ as a full subcategory of an ∞ -category which is much larger than \mathcal{C} . Let us remark that this is not necessary: the ∞ -category $\widehat{\mathcal{C}}$ is essentially of the same size as \mathcal{C} itself.

Proposition 8.5.5.6. *Let \mathcal{C} be an ∞ -category, let $\widehat{\mathcal{C}}$ be an idempotent completion of \mathcal{C} , and let κ be an uncountable cardinal. Then:*

- (1) *The ∞ -category \mathcal{C} is locally κ -small if and only if $\widehat{\mathcal{C}}$ is locally κ -small.*
- (2) *The ∞ -category \mathcal{C} is essentially κ -small if and only if $\widehat{\mathcal{C}}$ is essentially κ -small.*

Proof. Choose a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of \mathcal{C} . We first prove (1). Assume that \mathcal{C} is locally κ -small; we wish to show that $\widehat{\mathcal{C}}$ is locally κ -small

(the reverse implication follows immediately from the definition). Fix a pair of objects $Y, Y' \in \widehat{\mathcal{C}}$; we wish to show that the morphism space $\text{Hom}_{\widehat{\mathcal{C}}}(Y, Y')$ is essentially κ -small. By assumption, the object $Y \in \widehat{\mathcal{C}}$ is a retract of $H(X)$ for some object $X \in \mathcal{C}$. It follows that $\text{Hom}_{\widehat{\mathcal{C}}}(Y, Y')$ is a retract of $\text{Hom}_{\widehat{\mathcal{C}}}(H(X), Y')$ in the homotopy category hKan . By virtue of Corollary 8.5.1.14, it will suffice to show that the Kan complex $\text{Hom}_{\widehat{\mathcal{C}}}(H(X), Y')$ is essentially κ -small. Applying the same argument to Y' , we are reduced to showing that the mapping space $\text{Hom}_{\widehat{\mathcal{C}}}(H(X), H(X'))$ is essentially κ -small for every pair of objects $X, X' \in \mathcal{C}$. Since the functor F is fully faithful, the canonical map $\text{Hom}_{\mathcal{C}}(X, X') \rightarrow \text{Hom}_{\widehat{\mathcal{C}}}(H(X), H(X'))$ is a homotopy equivalence. The desired result now follows from our assumption that the ∞ -category \mathcal{C} is essentially κ -small.

We now prove (2). Assume that \mathcal{C} is essentially κ -small; we wish to show that $\widehat{\mathcal{C}}$ is also essentially κ -small (again, the reverse implication follows immediately from the definitions). Without loss of generality, we may assume that κ is the smallest cardinal for which \mathcal{C} is essentially κ -small, and is therefore regular (Corollary 5.4.6.14). By virtue of the criterion of Proposition 5.4.8.7, it will suffice to show that the set of isomorphism classes $S = \pi_0(\widehat{\mathcal{C}}^\simeq)$ is κ -small. For each object $X \in \mathcal{C}$, let $S_X \subseteq S$ be the collection of isomorphism classes of objects $Y \in \widehat{\mathcal{C}}$ which can be realized as a retract of $H(X)$. Note that we can write S as a union of the subsets S_X , where the X ranges over a set of representatives for the isomorphism classes in \mathcal{C} . Since κ is regular, and the set $\pi_0(\mathcal{C}^\simeq)$ is κ -small, it will suffice to show that each of the sets S_X is κ -small. Let us henceforth regard the object $X \in \mathcal{C}$ as fixed, and let Y be any retract of $H(X)$ in the ∞ -category $\widehat{\mathcal{C}}$. It follows from Proposition 8.5.2.4 that, as an object of the homotopy category $\text{h}\mathcal{C}$, Y can be identified with the equalizer of a pair of morphisms $(\text{id}, e) : H(X) \rightarrow H(X)$. It follows that the cardinality of the set of isomorphism classes S_X is bounded above by the cardinality of the set $\text{Hom}_{\text{h}\widehat{\mathcal{C}}}(H(X), H(X))$ of morphisms $e : H(X) \rightarrow H(X)$ in $\text{h}\mathcal{C}$, which we can identify with the κ -small set $\text{Hom}_{\text{h}\mathcal{C}}(X, X)$. \square

Let \mathcal{QC} denote the ∞ -category of (small) ∞ -categories (Construction 5.6.4.1), and let \mathcal{QC}^{ic} denote the full subcategory of \mathcal{QC} spanned by the idempotent complete ∞ -categories. Proposition 8.5.5.2 asserts that a functor $F : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as an idempotent completion of \mathcal{C} if and only if exhibits $\widehat{\mathcal{C}}$ as a \mathcal{QC}^{ic} -reflection of \mathcal{C} , in the sense of Definition 6.2.2.1. Consequently, Proposition 8.5.5.6 is equivalent to the assertion that $\mathcal{QC}^{\text{ic}} \subseteq \mathcal{QC}$ is reflective. Combining this observation with Proposition 6.2.2.8, we obtain the following:

- 0414 **Corollary 8.5.5.7.** *Then the inclusion functor $\mathcal{QC}^{\text{ic}} \hookrightarrow \mathcal{QC}$ admits a left adjoint, which carries each ∞ -category \mathcal{C} to an idempotent completion $\widehat{\mathcal{C}}$.*
- 0415 **Corollary 8.5.5.8.** *Let \mathcal{C} be an ∞ -category which can be realized as the limit of a small diagram $\mathcal{F} : \mathcal{D} \rightarrow \mathcal{QC}$. Suppose that, for each vertex $D \in \mathcal{D}$, the ∞ -category $\mathcal{F}(D)$ is idempotent complete. Then \mathcal{C} is idempotent complete.*

Proof. Combine Corollaries 8.5.5.7 and 7.1.3.22. \square

Corollary 8.5.5.9. *Let \mathcal{C} and \mathcal{D} be ∞ -categories. Suppose that \mathcal{D} is a retract of \mathcal{C} in the homotopy category hQCat . If \mathcal{C} is idempotent complete, then \mathcal{D} is also idempotent complete.*

Proof. By virtue of Remark 8.5.3.9, we can identify \mathcal{D} with the limit of a diagram $\mathrm{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{QC}$ carrying the unique object of Idem to the idempotent complete ∞ -category \mathcal{C} . The desired result is now a special case of Corollary 8.5.5.8. \square

Exercise 8.5.5.10. Give a direct proof of Corollary 8.5.5.9.

0417

8.5.6 Idempotent Endomorphisms

Let \mathcal{C} be an ∞ -category and let $F : \mathrm{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ be an idempotent in \mathcal{C} . Then F carries the unique object of Idem to an object $X \in \mathcal{C}$, and the unique non-identity morphism of Idem to an endomorphism $e : X \rightarrow X$ in \mathcal{C} . If \mathcal{C} is (the nerve of) an ordinary category, then the functor F is uniquely determined by the pair (X, e) (Remark 8.5.2.8). In more general situations, this is false: the simplicial set $\mathrm{N}_\bullet(\mathrm{Idem})$ contains a nondegenerate simplex of each dimension (Remark 8.5.3.3), so the specification of the functor F requires an infinite amount of data. Our goal in this section is to show that, nevertheless, the idempotent $F : \mathrm{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ can be recovered *up to isomorphism* from the underlying endomorphism (X, e) . We begin by introducing some terminology.

Notation 8.5.6.1. Let $\Delta^1 / \partial\Delta^1$ denote the simplicial circle (Example 1.4.7.10). For every ∞ -category \mathcal{C} , we let $\mathrm{End}_{\mathcal{C}}$ denote the ∞ -category of diagrams $\mathrm{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C})$. Note that objects of $\mathrm{End}_{\mathcal{C}}$ can be identified with pairs (X, e) , where X is an object of \mathcal{C} and $e : X \rightarrow X$ is an endomorphism of X . We will refer to $\mathrm{End}_{\mathcal{C}}$ as the ∞ -category of endomorphisms in \mathcal{C} .

Remark 8.5.6.2. Let \mathcal{C} be an ∞ -category. Evaluation on the unique vertex of $\Delta^1 / \partial\Delta^1$ induces an isofibration of ∞ -categories $\mathrm{End}_{\mathcal{C}} \rightarrow \mathcal{C}$. Moreover, for each object $X \in \mathcal{C}$, the fiber $\{X\} \times_{\mathcal{C}} \mathrm{End}_{\mathcal{C}}$ can be identified with the endomorphism space $\mathrm{End}_{\mathcal{C}}(X) = \mathrm{Hom}_{\mathcal{C}}(X, X)$ of Variant 4.6.1.3.

Definition 8.5.6.3 (Idempotent Endomorphisms). Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . We will say that e is *idempotent* if there exists a functor $F : \mathrm{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{e}) = e$; here \tilde{e} denotes the (unique) non-identity morphism in the category Idem . We let $\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$ denote the full subcategory of $\mathrm{End}_{\mathcal{C}}$ spanned by the idempotent endomorphisms.

We can now formulate our main result.

Proposition 8.5.6.4. *Let \mathcal{C} be an ∞ -category. Then the restriction functor*

$$\mathrm{Fun}(\mathrm{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \rightarrow \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$$

has a left homotopy inverse.

041C

Stated more informally, Proposition 8.5.6.4 asserts that if $e : X \rightarrow X$ is an endomorphism in the ∞ -category \mathcal{C} which can be extended to an idempotent $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$, then F is uniquely determined up to isomorphism and can be chosen to depend functorially on the pair (X, e) .

041D **Corollary 8.5.6.5.** *For every ∞ -category \mathcal{C} , evaluation on the non-identity morphism of Idem induces a bijection*

$$\theta : \pi_0(\text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})^\simeq) \rightarrow \pi_0((\text{End}_{\mathcal{C}}^{\text{idm}})^\simeq).$$

Proof. The surjectivity of θ follows from the definition of an idempotent endomorphism, and the injectivity from Proposition 8.5.6.4. \square

041E **Warning 8.5.6.6.** Let \mathcal{C} be an ∞ -category and let $R : \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}}^{\text{idm}}$ be the restriction functor. Proposition 8.5.6.4 asserts that there exists a functor $S : \text{End}_{\mathcal{C}}^{\text{idm}} \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$ for which the composition

$$\text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}) \xrightarrow{R} \text{End}_{\mathcal{C}}^{\text{idm}} \xrightarrow{S} \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}).$$

is isomorphic to the identity functor. Let $e : X \rightarrow X$ be an idempotent endomorphism in \mathcal{C} , so that e can be extended to a morphism $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$. Then $S(e) = (S \circ R)(F)$ is isomorphic to F , so there is an isomorphism of $(R \circ S)(e)$ with e in the category $\text{End}_{\mathcal{C}}^{\text{idm}}$. Beware that this isomorphism usually *cannot* be chosen to depend functorially on e . In general, the functor R is not an equivalence of ∞ -categories, so the composition

$$\text{End}_{\mathcal{C}}^{\text{idm}} \xrightarrow{S} \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}) \xrightarrow{R} \text{End}_{\mathcal{C}}^{\text{idm}}$$

is not isomorphic to the identity functor on $\text{End}_{\mathcal{C}}^{\text{idm}}$.

041F **Example 8.5.6.7.** For any ∞ -category \mathcal{C} , we have a commutative diagram

$$\begin{array}{ccc} & \mathcal{C} & \\ & \swarrow & \searrow \delta \\ \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}) & \xrightarrow{\quad} & \text{End}_{\mathcal{C}}^{\text{idm}}, \end{array}$$

where the vertical maps are the diagonal embeddings. If \mathcal{C} is a Kan complex, then the left vertical map is a homotopy equivalence of Kan complexes (since the simplicial set $N_\bullet(\text{Idem})$ is weakly contractible; see Remark 8.5.3.4). In this case, Proposition 8.5.6.4 reduces to the assertion that the diagonal map

$$\delta : \mathcal{C} \rightarrow \text{End}_{\mathcal{C}}^{\text{idm}} \subseteq \text{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C}) \quad X \mapsto (X, \text{id}_X)$$

has a left homotopy inverse. This is clear: the map δ has a left inverse in the category of simplicial sets, given by evaluation at the vertex of $\Delta^1/\partial\Delta^1$. Beware that δ is usually not a homotopy equivalence, since the simplicial set $\Delta^1/\partial\Delta^1$ is not contractible.

We will give the proof of Proposition 8.5.6.4 at the end of this section. First, let us introduce an important class of idempotent endomorphisms.

Definition 8.5.6.8. Let \mathcal{C} be an ∞ -category. We say that an endomorphism $e : X \rightarrow X$ in \mathcal{C} is *split idempotent* if the homotopy class $[e]$ is a split idempotent in the homotopy category $h\mathcal{C}$ (see Example 8.5.2.3).

Remark 8.5.6.9. Let \mathcal{C} be an ∞ -category. Then an endomorphism $e : X \rightarrow X$ is split idempotent if and only there exists a retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array}$$

in the ∞ -category \mathcal{C} , where e factors as a composition $X \xrightarrow{r} Y \xrightarrow{i} X$.

Proposition 8.5.6.10 (Lifting Split Idempotents). *Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . Then e is split idempotent endomorphism if and only if it extends to a split idempotent $N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$, in the sense of Definition 8.5.3.5. In particular, every split idempotent endomorphism is an idempotent endomorphism.*

Proof. Assume that the endomorphism e is split idempotent; we will show that e can be extended to a split idempotent $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ (the reverse implication follows immediately from the definitions). Choose a retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array} \tag{8.57}$$
041K

in the ∞ -category \mathcal{C} , where $[e] = [i] \circ [r]$ in the homotopy category $h\mathcal{C}$. Using Corollary 8.5.1.24, we can extend the diagram (8.57) to a functor $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$. By construction, \bar{F} carries the unique non-identity morphism of Idem to a morphism $e' : X \rightarrow X$ of \mathcal{C} which is homotopic to e . Replacing \bar{F} by an isomorphic functor if necessary, we may assume that $e' = e$ (see Corollary 4.4.5.3). Then $F = \bar{F}|_{N_\bullet(\text{Idem})}$ is a split idempotent in \mathcal{C} extending e . \square

Let \mathcal{C} be an ∞ -category. When restricted to *split* idempotents, Proposition 8.5.6.4 asserts every retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array}$$

can be recovered (up to canonical isomorphism) from a choice of composition $e = (i \circ r)$ in the ∞ -category \mathcal{C} . To prove this, we will exploit the observation that Y can be realized as the limit (and colimit) of the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots,$$

indexed by the 1-dimensional simplicial set $\text{Spine}[\mathbf{Z}]$ of Notation 8.5.4.12.

041L **Notation 8.5.6.11.** Let $q : \text{Spine}[\mathbf{Z}] \rightarrow \Delta^1 / \partial\Delta^1$ be the covering map of Remark 8.5.4.13. For every ∞ -category \mathcal{C} , precomposition with q induces a functor

$$T : \text{End}_{\mathcal{C}} = \text{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C}) \hookrightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C}) \quad (X, e) \mapsto T_e.$$

More informally, the functor T carries each endomorphism $e : X \rightarrow X$ in the ∞ -category \mathcal{C} to the associated sequential diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

041M **Proposition 8.5.6.12.** *Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an idempotent endomorphism in \mathcal{C} . Then e splits if and only if the diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ admits a limit.*

Proof. Since e is idempotent, it can be extended to a functor $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$. Then $T_e = F \circ Q$, where $Q : \text{Spine}[\mathbf{Z}] \rightarrow N_{\bullet}(\text{Idem})$ is the left cofinal morphism of Proposition 8.5.4.16. Using Corollary 7.2.2.10, we see that T_e has a limit in \mathcal{C} if and only if F has a limit in \mathcal{C} . The desired result now follows from the criterion of Corollary 8.5.3.11 \square

041N **Remark 8.5.6.13.** Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be a split idempotent endomorphism in \mathcal{C} , so that the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

admits both a limit and colimit in \mathcal{C} . The limit and colimit of this diagram are automatically preserved by any functor of ∞ -categories $\mathcal{C} \rightarrow \mathcal{D}$. This follows by combining Corollary 8.5.3.12 with Proposition 8.5.4.16.

Motivated by Proposition 8.5.6.12, we introduce a variant of Definition 8.5.6.8.

Definition 8.5.6.14. Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . We will say that e is *weakly split* if it satisfies the following conditions:

- (1) The diagram T_e of Notation 8.5.6.11 can be extended to a limit diagram in \mathcal{C} , which we depict as

$$\begin{array}{ccccccc} & & & Y & & & \\ & & & \downarrow i & & & \\ \dots & \longrightarrow & X & \xrightarrow{e} & X & \xrightarrow{e} & X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} \dots \end{array}$$

- (2) The diagram T_e of Notation 8.5.6.11 can be extended to a colimit diagram in \mathcal{C} , which we depict as

$$\begin{array}{ccccccc} \dots & \longrightarrow & X & \xrightarrow{e} & X & \xrightarrow{e} & X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} \dots \\ & & \searrow & & \downarrow r & & \swarrow \\ & & & & Z. & & \end{array}$$

- (3) The composition $Y \xrightarrow{i} X \xrightarrow{r} Z$ is an isomorphism in \mathcal{C} .

Our next goal is to show that every split idempotent endomorphism is weakly split.

Notation 8.5.6.15. Let Ret denote the category of Construction 8.5.0.2. Then the object $\tilde{Y} \in \text{Ret}$ is both initial and final. It follows that the diagram $Q : \text{Spine}[\mathbf{Z}] \rightarrow N_\bullet(\text{Idem})$ of Proposition 8.5.4.16 admits unique extensions

$$Q^- : \text{Spine}[\mathbf{Z}]^\triangleleft \rightarrow N_\bullet(\text{Ret}) \quad Q^+ : \text{Spine}[\mathbf{Z}]^\triangleright \rightarrow N_\bullet(\text{Ret})$$

which carry the cone points to the object \tilde{Y} .

Lemma 8.5.6.16. Let \mathcal{C} be an ∞ -category and let $F : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ be a functor. Then the composition $\text{Spine}[\mathbf{Z}]^\triangleleft \xrightarrow{Q^-} N_\bullet(\text{Ret}) \xrightarrow{F} \mathcal{C}$ is a limit diagram in \mathcal{C} , and the composition $\text{Spine}[\mathbf{Z}]^\triangleright \xrightarrow{Q^+} N_\bullet(\text{Ret}) \xrightarrow{F} \mathcal{C}$ is a colimit diagram in \mathcal{C} .

Proof. Combine Remark 8.5.3.9, Corollary 7.2.2.3, and Proposition 8.5.4.16. \square

Proposition 8.5.6.17. Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be a split idempotent endomorphism in \mathcal{C} . Then e is weakly split.

Proof. Let Ret denote the category introduced in Construction 8.5.0.2. Using Proposition 8.5.6.10, we can choose a functor $F : \text{N}_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{e}) = e$.

Let $Q : \text{Spine}[\mathbf{Z}] \rightarrow \text{N}_\bullet(\text{Idem})$ denote the (left and right) cofinal morphism of Proposition 8.5.4.16, and let $Q^- : \text{Spine}[\mathbf{Z}]^\triangleleft \rightarrow \text{N}_\bullet(\text{Ret})$ and $Q^+ : \text{Spine}[\mathbf{Z}]^\triangleright \rightarrow \text{N}_\bullet(\text{Ret})$ be the extensions of Notation 8.5.6.15. Lemma 8.5.6.16 guarantees that $F \circ Q^-$ is a limit diagram in \mathcal{C} extending $F \circ Q = T_e$, so that e satisfies condition (1) of Definition 8.5.6.14. Similarly, $F \circ Q^+$ is a colimit diagram extending T_e , so that e satisfies condition (2) of Definition 8.5.6.14. Condition (3) follows from the observation that any composition of $F(\tilde{i})$ with $F(\tilde{r})$ is homotopic to the morphism $F(\tilde{r} \circ \tilde{i}) = F(\text{id}_{\tilde{Y}}) = \text{id}_{F(\tilde{Y})}$, and is therefore an isomorphism. \square

041T **Warning 8.5.6.18.** The converse of Proposition 8.5.6.17 is false. For example, every isomorphism $e : X \rightarrow X$ is weakly split, but is split idempotent only if e is homotopic to the identity morphism id_X (see Example 8.5.2.2).

Let \mathcal{C} be an ∞ -category, and let $\text{End}_{\mathcal{C}}^w$ denote the full subcategory of $\text{End}_{\mathcal{C}}$ spanned by the weakly split endomorphisms in \mathcal{C} . It follows from Proposition 8.5.6.17 that the restriction functor

$$\text{Fun}(\text{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}} \quad F \mapsto F(e)$$

factors through $\text{End}_{\mathcal{C}}^w$. We will deduce Proposition 8.5.6.4 from the following:

041U **Proposition 8.5.6.19.** *Let \mathcal{C} be an ∞ -category. Then the restriction functor*

$$\text{Fun}(\text{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}}^w$$

admits a left homotopy inverse.

Proof. Let $\mathcal{D} \subseteq \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ denote the full subcategory spanned by those diagrams $S : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ which admit both a limit and a colimit. Let u and v be auxiliary symbols, and let $\tilde{\mathcal{D}}$ denote the full subcategory of $\text{Fun}(\{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\}, \mathcal{C})$ spanned by those diagrams $S^\pm : \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\} \rightarrow \mathcal{C}$ which satisfy the following conditions:

- (1) The restriction $S^- = S^\pm|_{\{u\} \star \text{Spine}[\mathbf{Z}]}$ is a limit diagram in \mathcal{C} .
- (2) The restriction $S^+ = S^\pm|_{\text{Spine}[\mathbf{Z}] \star \{v\}}$ is a colimit diagram in \mathcal{C} .

Note that the simplicial set $\text{Spine}[\mathbf{Z}]$ is weakly contractible (Remark 8.5.4.15), so that the inclusion map $\text{Spine}[\mathbf{Z}] \hookrightarrow \{u\} \star \text{Spine}[\mathbf{Z}]$ is right anodyne (Proposition 4.3.7.9). Applying Corollary 7.2.2.3, we can replace (2) by the condition that S^\pm is a colimit diagram in \mathcal{C} . Moreover, the functor S^- admits a colimit if and only if $S = S^\pm|_{\text{Spine}[\mathbf{Z}]}$ admits a colimit (Corollary 7.2.2.10). Invoking Corollary 7.3.6.15 twice, we deduce that the restriction functor

$$R : \tilde{\mathcal{D}} \rightarrow \mathcal{D} \quad S^\pm \mapsto S^\pm|_{\text{Spine}[\mathbf{Z}]}$$

is a trivial Kan fibration of ∞ -categories.

Let $\tilde{\mathcal{D}}^w$ denote the replete full subcategory of $\tilde{\mathcal{D}}$ spanned by those functors S^\pm for which the composition

$$\Delta^1 \simeq \{u\} \star \{v\} \hookrightarrow \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\} \xrightarrow{S^\pm} \mathcal{C}$$

is an isomorphism in \mathcal{C} . Let $\mathcal{D}^w \subseteq \mathcal{D}$ be the essential image of $\tilde{\mathcal{D}}^w$ under R , so that R restricts to a trivial Kan fibration $R^w : \tilde{\mathcal{D}}^w \rightarrow \mathcal{D}^w$.

Let $T : \text{End}_{\mathcal{C}} \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ be the functor given by precomposition with the covering map $\text{Spine}[\mathbf{Z}] \rightarrow \Delta^1 / \partial \Delta^1$ (see Notation 8.5.4.12). By definition, an endomorphism e of \mathcal{C} is weakly split if and only if the associated diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ is an object of \mathcal{D}^w . Consequently, the functor T restricts to a functor $T^w : \text{End}_{\mathcal{C}} \rightarrow \mathcal{D}_w$.

Since the object $\tilde{Y} \in \text{Ret}$ is both initial and final, the diagram $Q : \text{Spine}[\mathbf{Z}] \rightarrow N_\bullet(\text{Idem})$ admits an unique extension $Q^\pm : \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\} \rightarrow N_\bullet(\text{Ret})$ carrying both u and v to the object \tilde{Y} . It follows from Lemma 8.5.6.16 that precomposition with Q^\pm induces a functor

$$\tilde{T} : \text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \tilde{\mathcal{D}}^w \subseteq \text{Fun}(\{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\}, \mathcal{C}).$$

By construction, we have a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) & \xrightarrow{\tilde{T}} & \tilde{\mathcal{D}}^w \\ \downarrow & & \downarrow R^w \\ \text{End}_{\mathcal{C}}^w & \xrightarrow{T^w} & \mathcal{D}^w, \end{array}$$

where the right vertical map is a trivial Kan fibration. Consequently, to show that the left vertical map has a left homotopy inverse, it will suffice to show that the functor \tilde{T} has a left homotopy inverse.

Note that precomposition with the map

$$\Delta^2 \simeq \{u\} \star \{0\} \star \{v\} \hookrightarrow \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\}$$

determines an evaluation functor $\text{ev} : \tilde{\mathcal{D}} \rightarrow \text{Fun}(\Delta^2, \mathcal{C})$. Let $\text{Fun}^w(\Delta^2, \mathcal{C})$ denote the full subcategory of $\text{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams

$$\begin{array}{ccccc} & & X & & \\ & \nearrow i & & \searrow r & \\ Y & & u & & Y' \end{array}$$

where u is an isomorphism, so that ev restricts to a functor $\text{ev}^w : \tilde{\mathcal{D}}^w \rightarrow \text{Fun}^w(\Delta^2, \mathcal{C})$. It will therefore suffice to show that the composite functor

$$\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) \xrightarrow{\tilde{T}} \tilde{\mathcal{D}}^w \xrightarrow{\text{ev}^w} \text{Fun}^w(\Delta^2, \mathcal{C})$$

has a left homotopy inverse. We conclude by observing that this composite functor is an equivalence of ∞ -categories, by virtue of Corollary 8.5.1.26. \square

Proof of Proposition 8.5.6.4. Let \mathcal{C} be an ∞ -category. We wish to show that the restriction functor

$$R : \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}}^{\text{idm}}$$

has a left homotopy inverse. Using Corollary 8.5.5.3, we can choose a fully faithful functor $H : \mathcal{C} \rightarrow \mathcal{C}'$, where \mathcal{C}' is idempotent complete. Replacing \mathcal{C} by the essential image of H , we may assume without loss of generality that \mathcal{C} is a full subcategory of \mathcal{C}' (and H is the inclusion functor). Then R is the restriction of a functor $R' : \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}') \rightarrow \text{End}_{\mathcal{C}'}^{\text{idm}}$. Since \mathcal{C}' is idempotent complete, every idempotent endomorphism in \mathcal{C}' is split, and therefore weakly split. Applying Proposition 8.5.6.19, we deduce that the composition

$$\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}') \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}') \xrightarrow{R'} \text{End}_{\mathcal{C}'}^{\text{idm}} \subseteq \text{End}_{\mathcal{C}}^w$$

admits a left homotopy inverse. The restriction map $\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}') \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}')$ is an equivalence of ∞ -categories (Remark 8.5.4.8), so R' admits a left homotopy inverse $S' : \text{End}_{\mathcal{C}'}^{\text{idm}} \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C}')$. Restricting to the full subcategory $\text{End}_{\mathcal{C}}^{\text{idm}} \subseteq \text{End}_{\mathcal{C}'}^{\text{idm}}$, we obtain a functor $S : \text{End}_{\mathcal{C}}^{\text{idm}} \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$ which is left homotopy inverse to R . \square

8.5.7 Homotopy Idempotent Endomorphisms

041V Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . If e is idempotent (in the sense of Definition 8.5.6.3), then the homotopy class $[e]$ is an idempotent endomorphism in the homotopy category $\text{h}\mathcal{C}$. One can ask if the converse is true: if the homotopy class $[e]$ is an idempotent endomorphism in $\text{h}\mathcal{C}$, does it follow that e is an idempotent endomorphism of \mathcal{C} ? In this section, we will show that this question has a negative answer in general (Proposition 8.5.7.15), but a positive answer under some additional assumptions (Corollary 8.5.7.5). Let us begin by introducing some terminology.

041W **Definition 8.5.7.1.** Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . We say that e is *homotopy idempotent* if the homotopy class $[e]$ is an idempotent in the homotopy category $\text{h}\mathcal{C}$, in the sense of Definition 8.5.2.1.

Remark 8.5.7.2. Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . Then e is homotopy idempotent if and only if there exists a 2-simplex σ of \mathcal{C} whose boundary is indicated in the diagram

$$\begin{array}{ccc} & X & \\ e \nearrow & \swarrow e & \\ X & \xrightarrow{e} & X. \end{array}$$

Example 8.5.7.3. Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . If e is idempotent (that is, if it extends to a functor $N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$), then it is homotopy idempotent.

We now provide a partial converse to Example 8.5.7.3.

Proposition 8.5.7.4. Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . The following conditions are equivalent:

- (1) The homotopy class $[e]$ is a split idempotent in the homotopy category $\text{h}\mathcal{C}$.
- (2) The endomorphism e is a split idempotent in \mathcal{C} .
- (3) The endomorphism e is homotopy idempotent and weakly split (Definition 8.5.6.14).
- (4) The endomorphism e is homotopy idempotent and there exists a limit diagram

$$\begin{array}{ccccccc} & & Y & & & & \\ & & \downarrow & & \downarrow & & \\ & & i(-1) & & i(0) & & i(1) \\ & & \swarrow & \downarrow & \downarrow & \searrow & \\ \dots & \xrightarrow{\quad} & X & \xrightarrow{e} & X & \xrightarrow{e} & X \xrightarrow{e} \dots \end{array}$$

in \mathcal{C} , where the morphism $i(0)$ has a left homotopy inverse.

Proof. The equivalence $(1) \Leftrightarrow (2)$ is tautology, the implication $(2) \Rightarrow (3)$ follows from Proposition 8.5.6.17 (and Example 8.5.7.3), and the implication $(3) \Rightarrow (4)$ is immediate. We will complete the proof by showing that (4) implies (1) . Assume that e is homotopy

idempotent, so that there exists a 2-simplex σ of \mathcal{C} whose boundary is indicated in the diagram

$$\begin{array}{ccc} & X & \\ e \nearrow & & \searrow e \\ X & \xrightarrow{e} & X. \end{array}$$

Let $\text{Spine}[\mathbf{Z}]$ denote the 1-dimensional simplicial set of Notation 8.5.4.12, and let $T_\sigma : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}_{X/}$ be the morphism of simplicial sets which carries each vertex of $\text{Spine}[\mathbf{Z}]$ to e (regarded as an object of the coslice ∞ -category $\mathcal{C}_{X/}$) and each nondegenerate edge of $\text{Spine}[\mathbf{Z}]$ to σ (regarded as a morphism of the coslice ∞ -category $\mathcal{C}_{X/}$). We will identify T_σ with a diagram $\bar{T}_e : \text{Spine}[\mathbf{Z}]^\triangleleft \rightarrow \mathcal{C}$, where the restriction $\bar{T}_e|_{\text{Spine}[\mathbf{Z}]}$ is the diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ of Notation 8.5.6.11. Let us further identify \bar{T}_e with an object \bar{X} of the slice ∞ -category $\mathcal{C}_{/T_e}$, lying over the object $X \in \mathcal{C}$. By virtue of assumption (4), the ∞ -category $\mathcal{C}_{/T_e}$ has a final object \bar{Y} , lying over some object $Y \in \mathcal{C}$. We can therefore choose a morphism $\bar{r} : \bar{X} \rightarrow \bar{Y}$ in the ∞ -category $\mathcal{C}_{/T_e}$, having some image $r : X \rightarrow Y$ in \mathcal{C} . The morphism \bar{r} can be identified with a diagram $\Delta^1 \star \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$, which we display informally as

$$\begin{array}{ccccccc} & & X & & & & \\ & & \downarrow r & & & & \\ & & Y & & & & \\ & i(-1) \swarrow & & \downarrow i(0) & & i(1) \searrow & \\ \dots & \xrightarrow{e} & X & \xrightarrow{e} & X & \xrightarrow{e} & X \xrightarrow{e} \dots \end{array}$$

By construction, the restriction of this diagram to the middle column witnesses the equality $[i(0)] \circ [r] = [e]$ in the homotopy category $\text{h}\mathcal{C}$. To show that the homotopy class $[e]$ is a split idempotent, it will suffice to show that $[r] \circ [i(0)]$ is the identity morphism $[\text{id}_Y]$ in the homotopy category $\text{h}\mathcal{C}$. Since the morphism $[i(0)]$ admits a left inverse, it will suffice to

show that equality holds after postcomposition with $[i(0)]$. This follows from the calculation

$$\begin{aligned} [i(0)] \circ ([r] \circ [i(0)]) &= ([i(0)] \circ [r]) \circ [i(0)] \\ &= [e] \circ [i(0)] \\ &= [e] \circ ([e] \circ [i(-1)]) \\ &= ([e] \circ [e]) \circ [i(-1)] \\ &= [e] \circ [i(-1)] \\ &= [i(0)]. \end{aligned}$$

□

Corollary 8.5.7.5. *Let \mathcal{C} be an ∞ -category which admits sequential limits and colimits, and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . Then e is idempotent if and only if it is homotopy idempotent and the composite map*

$$\varprojlim(\cdots \rightarrow X \xrightarrow{e} X \rightarrow \cdots) \rightarrow X \rightarrow \varinjlim(\cdots \rightarrow X \xrightarrow{e} X \rightarrow \cdots)$$

is an isomorphism (see Definition 8.5.6.14).

Proof. This is a special case of Proposition 8.5.7.4, together with the observation that every idempotent in \mathcal{C} is split (Proposition 8.5.6.12). □

Let us now present a sample application of Proposition 8.5.7.4.

Corollary 8.5.7.6. *Let X be a connected Kan complex and let $x \in X$ be a vertex. Then every homotopy idempotent endomorphism $e : (X, x) \rightarrow (X, x)$ in the ∞ -category \mathcal{S}_* is (split) idempotent.*

Proof. Without loss of generality, we may assume that the morphism e is obtained from a morphism $(X, x) \rightarrow (X, x)$ in the ordinary category of pointed Kan complexes (see Proposition 5.6.3.8). Then the diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{S}_*$ of Notation 8.5.6.11 lifts to a functor of ordinary categories $\mathcal{F} : (\mathbf{Z}, \leq) \rightarrow \text{Kan}_*$, which we display as

$$\cdots \rightarrow (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \rightarrow \cdots$$

Let us abuse notation by identifying \mathcal{F} with its image in the category of Kan complexes Kan. Applying Variant 7.5.3.6, we can choose a levelwise homotopy equivalence $\alpha : \mathcal{F} \rightarrow \mathcal{G}$, where $\mathcal{G} : (\mathbf{Z}, \leq) \rightarrow \text{Kan}$ is an isofibrant diagram of Kan complexes. Note that we can also regard \mathcal{G} as a diagram of pointed Kan complexes, by equipping each $\mathcal{G}(n)$ with the base point $y_n = \alpha(n)(x)$. Let us extend \mathcal{G} to a functor $\mathcal{G}^\pm : (\mathbf{Z} \cup \{-\infty, \infty\}, \leq) \rightarrow \text{Kan}_*$ by setting $\mathcal{G}^\pm(-\infty) = \varprojlim(\mathcal{G})$ and $\mathcal{G}^\pm(\infty) = \varinjlim(\mathcal{G})$, where the limit and colimit are formed in the category of (pointed) simplicial sets; we denote the base points of $\mathcal{G}^\pm(-\infty)$ and $\mathcal{G}^\pm(\infty)$

by $y_{-\infty}$ and y_∞ , respectively. Passing to nerves, the functor \mathcal{G}^\pm determines a diagram $S : \{-\infty\} \star \text{Spine}[\mathbf{Z}] \star \{\infty\} \rightarrow \mathcal{S}_*$.

Let $U : \mathcal{S}_* \rightarrow \mathcal{S}$ be the forgetful functor (given on objects by $U(X, x) = X$). Since the diagram \mathcal{G} is isofibrant and the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_\bullet(\mathbf{Z})$ is left cofinal (Remark 8.5.4.14), the restriction $(U \circ S)|_{\{-\infty\} \star \text{Spine}[\mathbf{Z}]}$ is a limit diagram in the ∞ -category \mathcal{S} (Corollary 7.5.4.7). Applying Corollary 7.1.3.20, we see that $S|_{\{-\infty\} \star \text{Spine}[\mathbf{Z}]}$ is a limit diagram in the ∞ -category \mathcal{S}_* . Since the ∞ -category $N_\bullet(\mathbf{Z})$ is filtered and the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_\bullet(\mathbf{Z})$ is right cofinal, the restriction $(U \circ S)|_{\text{Spine}[\mathbf{Z}] \star \{\infty\}}$ is a colimit diagram in the ∞ -category \mathcal{S} (Corollary 7.5.9.3). Since the spine $\text{Spine}[\mathbf{Z}]$ is weakly contractible (Remark 8.5.4.15), it follows that $S|_{\text{Spine}[\mathbf{Z}] \star \{\infty\}}$ is a colimit diagram in the ∞ -category \mathcal{S}_* . Moreover, the natural transformation α induces an isomorphism $T_e \rightarrow S|_{\text{Spine}[\mathbf{Z}]}$ in the ∞ -category $\text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{S}_*)$. It follows that the morphism e is idempotent if and only if the composition

$$\Delta^1 \simeq \{-\infty\} \star \{\infty\} \hookrightarrow \{-\infty\} \star \text{Spine}[\mathbf{Z}] \star \{\infty\} \xrightarrow{S} \mathcal{S}_*$$

is an isomorphism in \mathcal{S}_* : that is, if and only if the map of Kan complexes

$$\theta : \mathcal{G}^\pm(-\infty) = \varprojlim(\mathcal{G}) \rightarrow \varinjlim(\mathcal{G}) = \mathcal{G}^\pm(\infty)$$

is a homotopy equivalence of (pointed) Kan complexes (Corollary 8.5.7.6).

Since each $\mathcal{G}(n)$ is a connected Kan complex, it follows that the colimit $\varinjlim(\mathcal{G})$ is also connected. By virtue of Theorem 3.2.7.1, it will suffice to show that, for every integer $d \geq 0$, θ induces a bijection $\pi_d(\varprojlim(\mathcal{G}), y_{-\infty}) \rightarrow \pi_d(\varinjlim(\mathcal{G}), y_\infty)$ (note that, in the case $d = 0$, this guarantees that the Kan complex $\varprojlim(\mathcal{G})$ is also connected, so that a similar conclusion holds for any choice of base point). Let \overleftarrow{G} denote the diagram of sets

$$\cdots \rightarrow \pi_d(\mathcal{G}(-1), y_{-1}) \rightarrow \pi_d(\mathcal{G}(0), y_0) \rightarrow \pi_d(\mathcal{G}(1), y_1) \rightarrow \cdots$$

Note that α determines an isomorphism of \overleftarrow{G} with the diagram

$$\cdots \rightarrow \pi_d(X, x) \xrightarrow{f_d} \pi_d(X, x) \xrightarrow{f_d} \pi_d(X, x) \rightarrow \cdots$$

where each of the transition maps is induced by e . Since e is homotopic to $e \circ e$ (in the homotopy category of pointed Kan complexes), it follows that $f_d = f_d \circ f_d$, so that the tautological map $v : \varprojlim(\overleftarrow{G}) \rightarrow \varinjlim(\overleftarrow{G})$ is a bijection. Unwinding the definition, we see that $\pi_d(\theta)$ factors as a composition

$$\pi_d(\varprojlim_n \mathcal{G}(n), y_\infty) \xrightarrow{u} \varprojlim_n \pi_d(\mathcal{G}(n), y_n) \xrightarrow{v} \varinjlim_n \pi_d(\mathcal{G}(n), y_n) \xrightarrow{w} \pi_d(\mathcal{G}(\infty), y_\infty),$$

where the map w is also bijective (Remark 3.2.2.15). It will therefore suffice to show that the map u is bijective. By virtue of the Milnor exact sequence (Proposition [?]), this is

equivalent to the assertion that the set

$$\varprojlim^1(\cdots \rightarrow \pi_{d+1}(\mathcal{G}(-2), y_{-2}) \rightarrow \pi_{d+1}(\mathcal{G}(-1), y_{-1}) \rightarrow \pi_{d+1}(\mathcal{G}(0), y_0))$$

has a single element. This is a special case of Proposition [?], since the inverse system of groups

$$\cdots \rightarrow \pi_{d+1}(X, x) \xrightarrow{f_{d+1}} \pi_{d+1}(X, x) \xrightarrow{f_{d+1}} \pi_{d+1}(X, x)$$

is Mittag-Leffler (since f_{d+1} is idempotent, its image coincides with the image of f_{d+1}^n for every integer $n > 0$). \square

Corollary 8.5.7.7. *Let X be a connected Kan complex and let $e : X \rightarrow X$ be a homotopy idempotent endomorphism in the ∞ -category \mathcal{S} . Then e is idempotent if and only if it can be lifted to a homotopy endomorphism endomorphism $\tilde{e} : (X, x) \rightarrow (X, x)$ in the ∞ -category \mathcal{S}_* .* 0422

Proof. Let $\tilde{e} : (X, x) \rightarrow (X, x)$ be a lift of e to a morphism in the ∞ -category \mathcal{S}_* . If \tilde{e} is homotopy idempotent, then it is idempotent (Corollary 8.5.7.6), so that e is also idempotent. For the converse, suppose that e is idempotent: that is, it can be extended to a functor $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$. Since the ∞ -category \mathcal{S} admits small colimits (Corollary 7.4.5.6), the idempotent F splits. Consequently, there is a retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array} \quad \begin{matrix} 0423 \\ (8.58) \end{matrix}$$

in the ∞ -category of spaces \mathcal{S} , where e is homotopic to the composition $(i \circ r) : X \rightarrow X$. Fix vertices $x \in X$ and $y \in Y$. Since X is connected, we can lift i to a morphism $\tilde{i} : (Y, y) \rightarrow (X, x)$ in the ∞ -category \mathcal{S}_* (see Example 5.6.3.4). Since the forgetful functor $\mathcal{S}_* \rightarrow \mathcal{S}$ is a left fibration, we can lift (8.58) to a retraction diagram

$$\begin{array}{ccc} & (X, x) & \\ \tilde{i} \nearrow & \swarrow \tilde{r} & \\ (Y, y) & \xrightarrow{\text{id}} & (Y, y) \end{array}$$

in the ∞ -category \mathcal{S}_* . It follows that e can be lifted to a (split) homotopy idempotent in \mathcal{S}_* , given by any composition of \tilde{r} with \tilde{i} . \square

0424 **Exercise 8.5.7.8.** Let (X, x) be a pointed Kan complex and let $e : X \rightarrow X$ be a morphism from X to itself. Show that:

- If X is connected, then e can be lifted to a morphism $\tilde{e} : (X, x) \rightarrow (X, x)$ in the ∞ -category \mathcal{S}_* .
- If X is simply connected, then e is homotopy idempotent (in the ∞ -category \mathcal{S}) if and only if \tilde{e} is homotopy idempotent (in the ∞ -category \mathcal{S}_*).

In particular, if X is simply connected, then every homotopy idempotent $e : X \rightarrow X$ is (split) idempotent (Corollary 8.5.7.7).

In the situation of Exercise 8.5.7.8, the simple connectivity assumption on X cannot be omitted. That is, not every homotopy idempotent in the ∞ -category \mathcal{S} is split. We present a counterexample, due originally to Freyd and Heller (see [22]).

0425 **Definition 8.5.7.9** (Dyadic Homeomorphisms). Recall that a *dyadic rational number* is a real number of the form $\frac{a}{2^n}$, where a and n are integers. Let $s, t \geq 0$ be dyadic rational numbers. We say that a homeomorphism $f : [0, s] \xrightarrow{\sim} [0, t]$ is *dyadic* if it satisfies the following conditions:

- The function f is piecewise linear; in particular, it is differentiable away from finitely many points of the closed interval $[0, s]$.
- If $x \in [0, s]$ is a point where f is not differentiable, then x is a dyadic rational number.
- For every point $x \in [0, s]$ where f is differentiable, the derivative $f'(x)$ is equal to 2^n for some integer n .

Note that the third condition implies that the homeomorphism f is strictly increasing, so that $f(0) = 0$ and $f(s) = t$.

0426 **Exercise 8.5.7.10** (Inverses of Dyadic Homeomorphisms). Let $s, t \geq 0$ be dyadic rational numbers and let $f : [0, s] \xrightarrow{\sim} [0, t]$ be a dyadic homeomorphism. Show that the inverse homeomorphism $f^{-1} : [0, t] \xrightarrow{\sim} [0, s]$ is also dyadic.

0427 **Exercise 8.5.7.11** (Composition of Dyadic Homeomorphisms). Let $s, t, u \geq 0$ be dyadic rational numbers and let $f : [0, s] \xrightarrow{\sim} [0, t]$ and $g : [0, t] \xrightarrow{\sim} [0, u]$ be dyadic homeomorphisms. Show that the composition $(g \circ f) : [0, s] \xrightarrow{\sim} [0, u]$ is also a dyadic homeomorphism.

0428 **Definition 8.5.7.12** (The Thompson Group). Let $\text{Aut}_{\text{Dy}}([0, 1])$ denote the collection of all dyadic homeomorphisms from the unit interval $[0, 1]$ to itself. It follows from Exercises 8.5.7.10 and 8.5.7.11 that $\text{Aut}_{\text{Dy}}([0, 1])$ has the structure of a group (where the group law is given by composition of homeomorphisms). We will refer to $\text{Aut}_{\text{Dy}}([0, 1])$ as the *Thompson group*.

Construction 8.5.7.13 (Speeding Up). Let $f : [0, 1] \rightarrow [0, 1]$ be an orientation-preserving homeomorphism. We define $\alpha(f) : [0, 1] \rightarrow [0, 1]$ by the formula

$$\alpha(f)(x) = \begin{cases} f(2x)/2 & \text{if } 0 \leq x \leq 1/2 \\ x & \text{if } 1/2 \leq x \leq 1. \end{cases}$$

Then $\alpha(f)$ is also an orientation-preserving homeomorphism of $[0, 1]$ with itself. Moreover, if f is dyadic, then $\alpha(f)$ is also dyadic. It follows that the construction $f \mapsto \alpha(f)$ determines a group homomorphism α from the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$ to itself.

Proposition 8.5.7.14. *Let $\text{Aut}_{\text{Dy}}([0, 1])$ be the Thompson group of Definition 8.5.7.12 and let $X = B_{\bullet} \text{Aut}_{\text{Dy}}([0, 1])$ denote its classifying simplicial set (Example 1.2.4.3). Then the homomorphism α of Construction 8.5.7.13 induces a homotopy idempotent endomorphism $e : X \rightarrow X$ in the ∞ -category \mathcal{S} .*

Proof. We wish to show that the diagram of Kan complexes

$$\begin{array}{ccc} & X & \\ e \nearrow & \swarrow & e \\ X & \xrightarrow{e} & X \end{array}$$

commutes up to homotopy. By virtue of Proposition 1.4.3.3, this is equivalent to the assertion that the homomorphisms $\alpha, \alpha^2 : \text{Aut}_{\text{Dy}}([0, 1]) \rightarrow \text{Aut}_{\text{Dy}}([0, 1])$ are conjugate: that is, there exists an element $g \in \text{Aut}_{\text{Dy}}([0, 1])$ satisfying the identity $\alpha(f) \circ g = g \circ \alpha^2(f)$ for every element $f \in \text{Aut}_{\text{Dy}}([0, 1])$. Concretely, we can take g to be any dyadic homeomorphism satisfying the identity $g(x) = 2x$ for $0 \leq x \leq 1/4$. \square

We now show that the homotopy idempotent of Proposition 8.5.7.14 cannot be refined to an idempotent in the ∞ -category \mathcal{S} .

Proposition 8.5.7.15. *Let $X = B_{\bullet} \text{Aut}_{\text{Dy}}([0, 1])$. Then homotopy idempotent endomorphism $e : X \rightarrow X$ of Proposition 8.5.7.14 is not idempotent.*

Proof. Let x denote the unique vertex of X . Suppose, for a contradiction, that e is idempotent. Then we can lift e to a homotopy idempotent morphism $\tilde{e} : (X, x) \rightarrow (X, x)$ in the ∞ -category \mathcal{S}_* (Corollary 8.5.7.7). Passing to fundamental groups, we obtain an idempotent homomorphism β from the Thompson group $\text{Aut}_{\text{Dy}}([0, 1]) = \pi_1(X, x)$ to itself. Since the forgetful functor $\mathcal{S}_* \rightarrow \mathcal{S}$ carries \tilde{e} to e , β is conjugate to the homomorphism α of Construction 8.5.7.13. Since α is a monomorphism, it follows that β is also a monomorphism. The equation $\beta^2 = \beta$ then implies that β is the identity map. This is a contradiction, since β is conjugate to the homomorphism α (which is not the identity morphism). \square

8.5.8 Partial Idempotents

- 042C Let Idem denote the category introduced in Construction 8.5.2.7. For each integer $n \geq 0$, we let $N_{\leq n}(\text{Idem})$ denote the n -skeleton of the simplicial set $N_{\bullet}(\text{Idem})$ (see Variant 1.2.1.5). If \mathcal{C} is an ∞ -category, we will refer to a morphism $N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$ as a *partial idempotent* in \mathcal{C} .
- 042D **Example 8.5.8.1.** The simplicial set $N_{\leq 0}(\text{Idem})$ is isomorphic to the standard simplex Δ^0 . Consequently, if \mathcal{C} is an ∞ -category, then a morphism $N_{\leq 0}(\text{Idem}) \rightarrow \mathcal{C}$ can be identified with an object $X \in \mathcal{C}$.
- 042E **Example 8.5.8.2.** The simplicial set $N_{\leq 1}(\text{Idem})$ can be identified with the simplicial circle $\Delta^1 / \partial\Delta^1$, obtained from the standard simplex Δ^1 by identifying its endpoints. Consequently, if \mathcal{C} is an ∞ -category, then a morphism $N_{\leq 1}(\text{Idem}) \rightarrow \mathcal{C}$ can be identified with a pair (X, e) , where X is an object of \mathcal{C} and e is an endomorphism of X .
- 042F **Example 8.5.8.3.** Let \mathcal{C} be an ∞ -category. Then a morphism $N_{\leq 2}(\text{Idem}) \rightarrow \mathcal{C}$ can be identified with a triple (X, e, σ) , where X is an object of \mathcal{C} , $e : X \rightarrow X$ is an endomorphism of X , and σ is a 2-simplex of \mathcal{C} with boundary indicated in the diagram

$$\begin{array}{ccc} & X & \\ e \nearrow & \swarrow e & \\ X & \xrightarrow{e} & X, \end{array}$$

so that σ witnesses the identity $[e] = [e] \circ [e]$ in the homotopy category $h\mathcal{C}$.

Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} , which we identify with a morphism $F_{\leq 1} : N_{\leq 1}(\text{Idem}) \rightarrow \mathcal{C}$. The endomorphism e is homotopy idempotent (in the sense of Definition 8.5.7.1) if and only if $F_{\leq 1}$ admits an extension $F_{\leq 2} : N_{\leq 2}(\text{Idem}) \rightarrow \mathcal{C}$. Proposition 8.5.7.15 shows that this condition does not guarantee the existence of an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ extending $F_{\leq 1}$. Our goal in this section is to show that a slightly stronger condition does suffice: namely, it is enough to assume that $F_{\leq 1}$ can be extended to a diagram $F_{\leq 3} : N_{\leq 3}(\text{Idem}) \rightarrow \mathcal{C}$. This is a consequence of the following:

- 042G **Theorem 8.5.8.4.** Let $n \geq 3$ be an integer. The inclusion map $N_{\leq n}(\text{Idem}) \hookrightarrow N_{\bullet}(\text{Idem})$ admits a factorization

$$N_{\leq n}(\text{Idem}) \xrightarrow{\iota} \mathcal{E} \xrightarrow{U} N_{\bullet}(\text{Idem}),$$

where \mathcal{E} is an ∞ -category, ι is an inner anodyne morphism which is bijective on simplices of dimension $< n$, and the functor U admits a right inverse $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{E}$.

Remark 8.5.8.5. In the situation of Theorem 8.5.8.5, we can regard ι and $V|_{N_{\leq n}(\text{Idem})}$ as 042H morphisms from $N_{\leq n}(\text{Idem})$ to \mathcal{E} . By construction, these morphisms coincide after composing with the functor $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$. Since U is bijective on simplices of dimensions $< n$, it follows that ι and $V|_{N_{\leq n}(\text{Idem})}$ coincide when on the $(n - 1)$ -skeleton of $N_{\bullet}(\text{Idem})$. Beware that ι and V do *not* coincide on the nondegenerate n -simplex of $N_{\bullet}(\text{Idem})$. In fact, we claim that ι and $V|_{N_{\leq n}(\text{Idem})}$ are not even isomorphic when viewed as an object of the ∞ -category $\text{Fun}(N_{\leq n}(\text{Idem}), \mathcal{E})$. Assume, for a contradiction, that there exists an isomorphism α of $\iota = \text{id}_{\mathcal{E}} \circ \iota$ with $V|_{N_{\leq n}(\text{Idem})} = (V \circ U) \circ \iota$. Since ι is inner anodyne, we could then lift α to an isomorphism $\tilde{\alpha} : \text{id}_{\mathcal{E}} \rightarrow V \circ U$ in the ∞ -category $\text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C})$. It would follow that U is an equivalence of ∞ -categories (with homotopy inverse given by V). Then $(U \circ \iota) : N_{\leq n}(\text{Idem}) \rightarrow N_{\bullet}(\text{Idem})$ would be a categorical equivalence of simplicial sets, which contradicts Remark 8.5.4.18.

We will give the proof of Theorem 8.5.8.4 at the end of this section. First, let us record some consequences.

Corollary 8.5.8.6. Let $n \geq 3$ be an integer, and let \mathcal{C} be an ∞ -category equipped with a 042J partial idempotent $F_{<n} : N_{\leq n-1}(\text{Idem}) \rightarrow \mathcal{C}$. The following conditions are equivalent:

- (1) The morphism $F_{<n}$ extends to an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$.
- (2) The morphism $F_{<n}$ extends to a partial idempotent $F_{\leq n} : N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$.

Proof. The implication $(1) \Rightarrow (2)$ is immediate. To prove the converse, suppose that $F_{\leq n} : N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$ is an extension of $F_{<n}$. Let $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$, $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$, and $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ be as in Theorem 8.5.8.4. Since ι is inner anodyne, we can choose a functor $\bar{F} : \mathcal{E} \rightarrow \mathcal{C}$ satisfying $\bar{F} \circ \iota = F_{\leq n}$. Then $F = \bar{F} \circ V$ is a functor from $N_{\bullet}(\text{Idem})$ to \mathcal{C} , and Remark 8.5.8.5 shows that F coincides with $F_{<n}$ on the $(n - 1)$ -skeleton of $N_{\bullet}(\text{Idem})$. \square

Warning 8.5.8.7. Let \mathcal{C} be an ∞ -category and let $F_{\leq n} : N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$ be a partial 042K idempotent in \mathcal{C} . Corollary 8.5.8.6 asserts that, if $n \geq 3$, then we can choose an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ such that F and $F_{\leq n}$ coincide on the $(n - 1)$ -skeleton $N_{\bullet}(\text{Idem})$. Beware that we generally cannot arrange that $F|_{N_{\leq n}(\text{Idem})}$ coincides with $F_{\leq n}$. For example, this always fails in the (universal) case $F_{\leq n}$ is the inner anodyne morphism $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$ of Theorem 8.5.8.4 (see Remark 8.5.8.5).

Corollary 8.5.8.8. Let \mathcal{C} be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in \mathcal{C} . 042L Then e is idempotent if and only if it can be extended to a diagram $N_{\leq 3}(\text{Idem}) \rightarrow \mathcal{C}$.

Corollary 8.5.8.9. Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category 042M \mathcal{I} . Suppose that each \mathcal{C}_i is an ∞ -category. Then the tautological map

$$\theta : \varinjlim_{i \in \mathcal{I}} \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) \rightarrow \text{Fun}(N_{\bullet}(\text{Idem}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i)$$

is an equivalence of ∞ -categories.

Proof. Choose any integer $n \geq 3$, and let $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$, $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$, and $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{E}$ be as in Theorem 8.5.8.4. We then have a commutative diagram of ∞ -categories

$$\begin{array}{ccccc} \varinjlim \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) & \xrightarrow{\circ V} & \varinjlim \text{Fun}(\mathcal{E}, \mathcal{C}_i) & \xrightarrow{\circ U} & \varinjlim \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) \\ \downarrow \theta & & \downarrow \theta' & & \downarrow \theta \\ \text{Fun}(N_{\bullet}(\text{Idem}), \varinjlim \mathcal{C}_i) & \xrightarrow{\circ V} & \text{Fun}(\mathcal{E}, \varinjlim \mathcal{C}_i) & \xrightarrow{\circ U} & \text{Fun}(N_{\bullet}(\text{Idem}), \varinjlim \mathcal{C}_i), \end{array}$$

where the horizontal compositions are identity morphisms. Consequently, to show that θ is an equivalence of ∞ -categories, it will suffice to show that θ' is an equivalence of ∞ -categories (Proposition 8.5.1.6). The functor θ' fits into a commutative diagram

$$\begin{array}{ccc} \varinjlim \text{Fun}(\mathcal{E}, \mathcal{C}_i) & \xrightarrow{\circ \iota} & \varinjlim \text{Fun}(N_{\leq n}(\text{Idem}), \mathcal{C}_i) \\ \downarrow \theta' & & \downarrow \theta'' \\ \text{Fun}(\mathcal{E}, \varinjlim \mathcal{C}_i) & \xrightarrow{\circ \iota} & \text{Fun}(N_{\leq n}(\text{Idem}), \varinjlim \mathcal{C}_i). \end{array}$$

Since ι is inner anodyne, the horizontal maps are trivial Kan fibrations (Proposition 1.4.7.6). We conclude by observing that θ'' is an isomorphism of simplicial sets, since the simplicial set $N_{\leq n}(\text{Idem})$ is finite (Corollary 3.5.1.10). \square

042N **Corollary 8.5.8.10.** *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category \mathcal{I} . Suppose that each \mathcal{C}_i is an idempotent complete ∞ -category. Then the colimit $\mathcal{C} = \varinjlim_i \mathcal{C}_i$ is idempotent complete.*

Proof. For each object $i \in \mathcal{I}$, our assumption that \mathcal{C}_i is idempotent complete guarantees that the restriction functor $R_i : \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}_i) \rightarrow \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i)$ is an equivalence of ∞ -categories (Remark 8.5.4.8). Passing to filtered colimits, we deduce that the induced map $\varinjlim \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}_i) \rightarrow \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i)$ is also an equivalence of ∞ -categories (Corollary 4.5.7.2). This map fits into a commutative diagram

$$\begin{array}{ccc} \varinjlim \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}_i) & \longrightarrow & \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}) \\ \downarrow & & \downarrow R \\ \varinjlim \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) & \longrightarrow & \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories (Corollaries 8.5.8.9 and 8.5.1.27). It follows that the restriction functor $R : \text{Fun}(\text{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(\text{N}_\bullet(\text{Idem}), \mathcal{C})$ is also an equivalence of ∞ -categories, so that \mathcal{C} is idempotent complete (Remark 8.5.4.8). \square

Corollary 8.5.8.11. *Let \mathcal{C} be a small filtered ∞ -category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a functor. Suppose that, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{F}(C)$ is idempotent complete. Then the colimit $\varinjlim(\mathcal{F})$ (formed in the ∞ -category \mathcal{QC}) is also idempotent complete.* 042P

Proof. Using Theorem 7.2.7.2, we can choose a directed partially ordered set (A, \leq) and a right cofinal functor $\text{N}_\bullet(A) \rightarrow \mathcal{C}$. Using Corollary 7.2.2.3 we can replace \mathcal{C} by $\text{N}_\bullet(A)$ and thereby reduce to the case where \mathcal{C} is (the nerve of) a directed partially ordered set. Replacing \mathcal{F} by an isomorphic functor if necessary, we can assume that it obtained from an A -indexed diagram in the ordinary category QCat (Corollary 5.7.5.16). In this case, the colimit $\varinjlim(\mathcal{F})$ in the ∞ -category \mathcal{QC} can be identified with its colimit in the ordinary category QCat $\subset \text{Set}_\Delta$ (Corollary 7.5.9.3), so the desired result follows from Corollary 8.5.8.10. \square

We now turn to the proof of Theorem 8.5.8.4. The existence of an inner anodyne morphism $\iota : \text{N}_{\leq n}(\text{Idem}) \rightarrow \mathcal{E}$ which is bijective on simplices of dimension $< n$ is essentially formal, by virtue of the following variant of Corollary 4.1.3.3:

Lemma 8.5.8.12. *Let $n \geq 0$ be an integer and let K be a simplicial set which satisfies the following condition for $0 \leq m \leq n$:* 042Q

$(*_m)$ *For every integer $0 < i < m$, every morphism of simplicial sets $\sigma : \Lambda_i^m \rightarrow K$ can be extended to an m -simplex of K .*

Then there exists an inner anodyne morphism $\iota : K \hookrightarrow \mathcal{E}$, where \mathcal{E} is an ∞ -category and ι is bijective on simplices of dimension $< n$.

Proof. We construct \mathcal{E} as the colimit of a sequence of inner anodyne maps

$$K = K(0) \hookrightarrow K(1) \hookrightarrow K(2) \hookrightarrow K(3) \hookrightarrow \dots$$

Assume that $K(t)$ has been constructed for some $t \geq 0$, and let S be the collection of all maps $\sigma : \Lambda_i^m \rightarrow K(t)$ where $0 < i < m$ and $m > n$. For every $\sigma \in S$, let us write C_σ for the simplicial set Λ_i^m which is the source of σ , and D_σ for the simplex Δ^m . We then construct a pushout diagram of simplicial sets

$$\begin{array}{ccc} \coprod_{\sigma \in S} C_\sigma & \longrightarrow & K(t) \\ \downarrow & & \downarrow \\ \coprod_{\sigma \in S} D_\sigma & \longrightarrow & K(t+1). \end{array}$$

By construction, the morphism $K(t) \rightarrow K(t+1)$ is inner anodyne and bijective on simplices of dimension $< n$. To complete the proof, it will suffice to show that the colimit $\mathcal{E} = \varinjlim_t K(t)$ is an ∞ -category. Fix a pair of integers $0 < i < m$ and a morphism $\sigma : \Lambda_i^m \rightarrow \mathcal{E}$; we wish to show that σ can be extended to an m -simplex of \mathcal{E} . Since Λ_i^m is a finite simplicial set, σ factors (uniquely) through $K(t)$ for some integer $t \gg 0$. By construction, if $m > n$ then σ can be extended to an m -simplex of $K(t+1)$. We may therefore assume that $m \leq n$. In this case, we can take $k = 0$, in which case the existence of the desired extension follows from assumption $(*_m)$. \square

042R **Example 8.5.8.13.** Let \mathcal{C} be an ∞ -category. For every integer $n \geq 0$, the skeleton $\text{sk}_n(\mathcal{C})$ satisfies condition $(*_m)$ of Lemma 8.5.8.12 for $0 \leq m \leq n$. We can therefore choose an inner anodyne morphism $\iota : \text{sk}_n(\mathcal{C}) \hookrightarrow \mathcal{E}$, where \mathcal{E} is an ∞ -category and f is bijective on simplices of dimension $< n$.

In what follows, we will write X for the unique object of the category Idem , and $e : X \rightarrow X$ for the unique non-identity morphism. The main content of Theorem 8.5.8.4 is contained in the following result:

042S **Proposition 8.5.8.14.** *Let \mathcal{E} be an ∞ -category and let $\iota : N_{\leq 3}(\text{Idem}) \rightarrow \mathcal{E}$ be a morphism of simplicial sets which is bijective on simplices of dimension ≤ 2 . Then $\iota(\tilde{e})$ is an idempotent morphism of \mathcal{E} .*

Proof. Let us regard the linearly ordered set $\mathbf{Z} = \{\dots < -2 < -1 < 0 < 1 < 2 < \dots\}$ as a category. Let $X \in \text{Fun}(\mathbf{Z}, \text{Idem})$ denote the constant functor taking the value X , and let $Y \in \text{Fun}(\mathbf{Z}, \text{Idem})$ denote the functor which carries each non-identity morphism of \mathbf{Z} to the morphism \tilde{e} of Idem . We then have natural transformations

$$e_X : X \rightarrow X \quad i : Y \rightarrow X \quad r : X \rightarrow Y \quad e_Y : Y \rightarrow Y$$

which carry each element of \mathbf{Z} to the morphism \tilde{e} . Note that the linearly ordered set (\mathbf{Z}, \leq) can be identified with the homotopy category of the simplicial set $\text{Spine}[\mathbf{Z}]$ of Notation 8.5.4.12. Let $G : \text{Fun}(\text{Spine}[\mathbf{Z}], N_{\leq 3}(\text{Idem})) \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E})$ be the morphism of simplicial sets given by composition with ι . Since the simplicial set $\text{Spine}[\mathbf{Z}]$ is 1-dimensional, the inclusion map

$$\text{Fun}(\text{Spine}[\mathbf{Z}], N_{\leq 3}(\text{Idem})) \hookrightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], N_{\bullet}(\text{Idem})) \simeq N_{\bullet}(\text{Fun}(\mathbf{Z}, \text{Idem}))$$

is bijective on simplices of dimension ≤ 2 , and therefore induces an equivalence of homotopy categories. It follows that G induces a functor of homotopy categories $hG : \text{Fun}(\mathbf{Z}, \text{Idem}) \rightarrow h\text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E})$.

In what follows, we will identify the morphisms X and Y with vertices of the simplicial set $\text{Fun}(\text{Spine}[\mathbf{Z}], N_{\leq 3}(\text{Idem}))$, and the morphisms i , r , e_X , and e_Y with edges of the simplicial

set $\text{Fun}(\text{Spine}[\mathbf{Z}], \text{N}_{\leq 3}(\text{Idem}))$. Let $\delta_{\mathcal{E}} : \mathcal{E} \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E})$ be the diagonal map, so that we have $G(X) = \delta_{\mathcal{C}}(\iota(\tilde{X}))$ and $G(e_X) = \delta_{\mathcal{C}}(\iota(\tilde{e}))$. We will deduce Proposition 8.5.8.14 from the following:

- (*) There exists an ∞ -category \mathcal{C} and a functor $T : \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E}) \rightarrow \mathcal{C}$ such that $(T \circ \delta_{\mathcal{E}}) : \mathcal{E} \rightarrow \mathcal{C}$ is fully faithful and $(T \circ G)(e_Y)$ is an isomorphism in \mathcal{C} .

Let us first assume (*), and show that it implies Proposition 8.5.8.14. We wish to show that $\iota(\tilde{e})$ is an idempotent endomorphism in the ∞ -category \mathcal{E} . Since $T \circ \delta_{\mathcal{E}}$ is fully faithful, this is equivalent to the statement that $(T \circ \delta_{\mathcal{C}})(\iota(\tilde{e})) = (T \circ G)(e_X)$ is an idempotent endomorphism in the ∞ -category \mathcal{C} . By virtue of Proposition 8.5.6.10, it will suffice to show that the homotopy class $[T(G(e_X))] = (\text{h} T \circ \text{h} G)(e_X)$ is a split idempotent in the homotopy category $\text{h}\mathcal{C}$. By construction, the morphism e_X factors as a composition $i \circ r$ in the category $\text{Fun}(\mathbf{Z}, \text{Idem})$. It will therefore suffice to show that the functor $\text{h} T \circ \text{h} G$ carries the commutative diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & \swarrow r & \\ Y & \xrightarrow{e_Y} & Y \end{array}$$

to a retraction diagram in $\text{h}\mathcal{C}$: that is, that $(\text{h} T \circ \text{h} G)(e_Y)$ is an identity morphism. This follows from Remark 8.5.2.2, since the morphism $(\text{h} T \circ \text{h} G)(e_Y)$ is both idempotent (since e_Y is an idempotent in the category $\text{Fun}(\mathbf{Z}, \text{Idem})$) and an isomorphism (by virtue of assumption (*)).

We now prove (*). Using Corollary 8.3.3.17, we can choose a fully faithful functor of ∞ -categories $H : \mathcal{E} \rightarrow \mathcal{C}$, where the ∞ -category \mathcal{C} admits sequential colimits. Let \mathcal{D} denote the full subcategory of $\text{Fun}(\text{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C})$ spanned by the colimit diagrams. Our assumption that \mathcal{C} admits sequential colimits guarantees that the restriction functor

$$\mathcal{D} \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C}) \quad U \mapsto U|_{\text{Spine}[\mathbf{Z}]}$$

is a trivial Kan fibration of ∞ -categories (Corollary 7.3.6.15). Let $\delta_{\mathcal{C}} : \mathcal{C} \hookrightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ and $\tilde{\delta}_{\mathcal{C}} : \mathcal{C} \hookrightarrow \text{Fun}(\text{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C})$ be the diagonal embeddings. Since the simplicial set $\text{Spine}[\mathbf{Z}]$ is weakly contractible, the morphism $\tilde{\delta}_{\mathcal{C}}$ factors through \mathcal{D} (Corollary 7.2.3.5). Let

$s : \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C}) \rightarrow \mathcal{D}$ be a solution to the lifting problem

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{\delta}_{\mathcal{C}}} & \mathcal{D} \\ \downarrow \delta_{\mathcal{C}} & \nearrow s & \downarrow U \mapsto U|_{\text{Spine}[\mathbf{Z}]} \\ \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C}) & \xrightarrow{\text{id}} & \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C}). \end{array}$$

Let $\text{ev} : \mathcal{D} \rightarrow \mathcal{C}$ be the functor given by evaluation at the cone point of $\text{Spine}[\mathbf{Z}]^\triangleright$. We let $T : \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E}) \rightarrow \mathcal{C}$ denote the functor given by the composition

$$\text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E}) \xrightarrow{H \circ} \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C}) \xrightarrow{s} \text{Fun}(\text{Spine}[\mathbf{Z}]^\triangleright, \mathcal{C}) \xrightarrow{\text{ev}} \mathcal{C}.$$

Stated more informally, the functor T carries a diagram

$$\cdots \rightarrow C_{-2} \rightarrow C_{-1} \rightarrow C_0 \rightarrow C_1 \rightarrow C_2 \rightarrow \cdots$$

in the ∞ -category \mathcal{E} to a colimit of the diagram

$$\cdots \rightarrow H(C_{-2}) \rightarrow H(C_{-1}) \rightarrow H(C_0) \rightarrow H(C_1) \rightarrow H(C_2) \rightarrow \cdots$$

in the ∞ -category \mathcal{C} . By construction, $T \circ \delta_{\mathcal{E}}$ coincides with the fully faithful functor H .

We now complete the proof by showing that the functor T carries $G(e_Y)$ to an isomorphism in \mathcal{C} . Let us regard $G(\tilde{Y})$ as a diagram $\text{Spine}[\mathbf{Z}] \rightarrow \mathcal{E}$. Since the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_\bullet(\mathbf{Z})$ is inner anodyne (Remark 8.5.4.14), we can extend $G(Y)$ to a functor $C : N_\bullet(\mathbf{Z}) \rightarrow \mathcal{E}$. Let $a : \{0 < 1\} \times \mathbf{Z} \rightarrow \mathbf{Z}$ be the morphism of partially ordered sets given by $a(i, n) = i + n$. Passing to nerves, we obtain a morphism of simplicial sets $A : \Delta^1 \times N_\bullet(\mathbf{Z}) \rightarrow N_\bullet(\mathbf{Z})$. The composition $M = C \circ A$ then corresponds to a diagram in \mathcal{E} which we display informally as

$$\begin{array}{ccccccc} \cdots & \longrightarrow & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) \xrightarrow{\iota(\tilde{e})} \cdots \\ & & \downarrow \iota(\tilde{e}) & & \downarrow \iota(\tilde{e}) & & \downarrow \iota(\tilde{e}) \\ \cdots & \longrightarrow & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) \xrightarrow{\iota(\tilde{e})} \cdots \end{array}$$

Let f denote the restriction $M|_{\Delta^1 \times \text{Spine}[\mathbf{Z}]}$, which we regard as a morphism in the ∞ -category $\text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E})$. Since ι is bijective on simplices of dimension ≤ 2 and the simplicial set $\text{Spine}[\mathbf{Z}]$ has dimension ≤ 1 , the morphism G is bijective on simplices of dimension ≤ 1 . We can therefore write $f = G(f_0)$ for a unique edge f_0 of $\text{Fun}(\text{Spine}[\mathbf{Z}], N_{\leq 3}(\text{Idem}))$. It follows

by inspection that f_0 must coincide with $e_{\widetilde{Y}}$. We are therefore reduced to showing that $T(f)$ is an isomorphism in the ∞ -category \mathcal{C} .

Since the ∞ -category \mathcal{C} admits sequential colimits, we can extend $(H \circ C) : N_\bullet(\mathbf{Z}) \rightarrow \mathcal{C}$ to a colimit diagram $\overline{C} : N_\bullet(\mathbf{Z})^\triangleright \rightarrow \mathcal{C}$. Note that A extends uniquely to a morphism of simplicial sets $\overline{A} : \Delta^1 \times N_\bullet(\mathbf{Z})^\triangleright \rightarrow N_\bullet(\mathbf{Z})^\triangleright$ (given on vertices by $\overline{A}(i, v) = v$, where v is the cone point of $N_\bullet(\mathbf{Z})^\triangleright$). Let us identify the restriction $(\overline{C} \circ \overline{A})|_{\Delta^1 \times \text{Spine}[\mathbf{Z}]^\triangleright}$ with a morphism $\overline{f} : D \rightarrow D'$ in the ∞ -category $\text{Fun}(\text{Spine}[\mathbf{Z}]^\triangleright, \mathcal{C})$. Since the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_\bullet(\mathbf{Z})$ is right cofinal (Proposition 7.2.1.3), both D and D' are colimit diagrams in \mathcal{D} (Corollary 7.2.2.3). Consequently, we can view \overline{f} as a morphism in the ∞ -category \mathcal{D} . By construction, the restriction functor $\mathcal{D} \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ carries \overline{f} to $H(f)$. It follows that $T(f) = (\text{ev} \circ s \circ H)(f)$ is isomorphic to $\text{ev}(\overline{f})$ as an object of the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$. We are therefore reduced to showing that $\text{ev}(\overline{f})$ is an isomorphism in \mathcal{C} . This is clear: the morphism $\text{ev}(\overline{f})$ is an identity morphism in \mathcal{C} , since the functor \overline{A} carries $\Delta^1 \times \{v\}$ to a degenerate edge of $N_\bullet(\mathbf{Z})^\triangleright$. \square

Proof of Theorem 8.5.8.4. Fix an integer $n \geq 0$. Using Example 8.5.8.13, we can choose an ∞ -category \mathcal{E} and an inner anodyne morphism $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$ which is bijective on simplices of dimension $< n$. Since ι is inner anodyne, there is a unique functor $U : \mathcal{E} \rightarrow N_\bullet(\text{Idem})$ for which $U \circ \iota$ coincides with the inclusion map $N_{\leq n}(\text{Idem}) \hookrightarrow N_\bullet(\text{Idem})$. If $n \geq 3$, then Proposition 8.5.8.14 guarantees that $\iota(\tilde{e})$ is an idempotent endomorphism in \mathcal{E} : that is, there exists a functor $V : N_\bullet(\text{Idem}) \rightarrow \mathcal{E}$ satisfying $V(\tilde{e}) = \iota(\tilde{e})$. To complete the proof, it will suffice to show that the composition $N_\bullet(\text{Idem}) \xrightarrow{V} \mathcal{E} \xrightarrow{U} N_\bullet(\text{Idem})$ is the identity functor. This follows from the universal property of Remark 8.5.2.8 (together with Proposition 1.2.2.1), it since the functor $U \circ V$ carries the morphism e to itself. \square

8.5.9 The Thompson Groupoid

In §8.5.7, we constructed an example of a homotopy idempotent endomorphism $e : X \rightarrow X$ which is not idempotent. Our construction (following Heller and Freyd) involved the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$. Our goal in this section is to show that this is no coincidence: there is a universal example of an ∞ -category \mathcal{C} containing a homotopy idempotent endomorphism, whose structure can be described explicitly in terms of $\text{Aut}_{\text{Dy}}([0, 1])$. We begin with a variant of Definition 8.5.7.12.

Definition 8.5.9.1 (The Thompson Groupoid). We define a category Dy as follows:

042U

- The objects of Dy are closed intervals of the form $[0, s]$, where $s \geq 0$ is a dyadic rational number.
- If $s, t \geq 0$ are dyadic rational numbers, then a morphism from $[0, s]$ to $[0, t]$ in the category Dy is a dyadic homeomorphism $[0, s] \xrightarrow{\sim} [0, t]$ (see Definition 8.5.7.9).

- The composition law on Dy is given by composition of dyadic homeomorphisms (which is well-defined by virtue of Exercise 8.5.7.11).

It follows from Exercise 8.5.7.10 that the category Dy is a groupoid. We will refer to Dy as the *Thompson groupoid*.

042V **Remark 8.5.9.2.** The Thompson groupoid Dy contains exactly two isomorphism classes:

- The isomorphism class of the degenerate interval $[0, 0] = \{0\}$, whose automorphism group is the trivial group.
- The isomorphism class of the unit interval $[0, 1]$, whose automorphism group is the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$ of Definition 8.5.7.12.

By virtue of Remark 8.5.9.2, the Thompson groupoid Dy is equivalent to the full subcategory spanned by the objects $\{0\}$ and $[0, 1]$, which can be described explicitly in terms of the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$. However, allowing a larger class of intervals in the definition reveals some additional structure.

042W **Construction 8.5.9.3** (Concatenation). Let Dy denote the Thompson groupoid. We define a functor $\circledast : \text{Dy} \times \text{Dy} \rightarrow \text{Dy}$ as follows:

- On objects, the functor \circledast is given by the formula

$$[0, s] \circledast [0, t] = [0, s + t].$$

- On morphisms, the functor \circledast is given by the formula

$$(f \circledast g)(x) = \begin{cases} g(x) & \text{if } 0 \leq x \leq t \\ f(x - t) + s & \text{if } t \leq x \leq s + t. \end{cases}$$

We will refer to $\circledast : \text{Dy} \times \text{Dy} \rightarrow \text{Dy}$ as the *concatenation functor* on the Thompson groupoid Dy . Note that the operation \circledast is strictly associative, and admits a (strict) unit given by the degenerate interval $\{0\} = [0, 0]$. Consequently, \circledast determines a strict monoidal structure on the category Dy (in the sense of Definition 2.1.2.1).

042X **Notation 8.5.9.4.** Let $B\text{Dy}$ denote the (strict) 2-category obtained by delooping Dy (see Example 2.2.0.8). Since Dy is a groupoid, $B\text{Dy}$ is a $(2, 1)$ -category. It follows that the Duskin nerve $N_{\bullet}^{\text{D}}(B\text{Dy})$ is an ∞ -category (Theorem 2.3.2.1). We can describe the low-dimensional simplices of $N_{\bullet}^{\text{D}}(B\text{Dy})$ explicitly as follows:

- The ∞ -category $N_{\bullet}^{\text{D}}(B\text{Dy})$ has a unique object, which we will denote by \overline{X} .

- Morphisms from \overline{X} to itself in the ∞ -category $N_\bullet^D(BDy)$ can be identified with nonnegative dyadic rational numbers s (corresponding to the closed interval $[0, s]$, regarded as an object of the Thompson groupoid Dy).
- Suppose we are given dyadic rational numbers $s, t, u \geq 0$. Then 2-simplices of $N_\bullet^D(BDy)$ with boundary indicated in the diagram

$$\begin{array}{ccc} & \overline{X} & \\ t \nearrow & \swarrow s & \\ \overline{X} & \xrightarrow{u} & \overline{X} \end{array}$$

can be identified with dyadic homeomorphisms $[0, s+t] \xrightarrow{\sim} [0, u]$.

Let $\bar{e} : \overline{X} \rightarrow \overline{X}$ denote the morphism in $N_\bullet^D(BDy)$ corresponding to the object $[0, 1] \in Dy$, and let $\bar{\sigma}$ be the 2-simplex of $N_\bullet^D(BDy)$ corresponding to the dyadic homeomorphism

$$[0, 1] \otimes [0, 1] = [0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2.$$

Then the triple $(\overline{X}, \bar{e}, \bar{\sigma})$ can then be viewed as a partial idempotent $\iota : N_{\leq 2}(Idem) \rightarrow N_\bullet^D(BDy)$ (see Example 8.5.8.3).

We can now formulate our main result:

Theorem 8.5.9.5. *The partial idempotent $\iota : N_{\leq 2}(Idem) \rightarrow N_\bullet^D(BDy)$ of Notation 8.5.9.4 042Y is a categorical equivalence of simplicial sets.*

Corollary 8.5.9.6. *Let \mathcal{C} be an ∞ -category. Then composition with the partial idempotent 042Z ι of Notation 8.5.9.4 induces a trivial Kan fibration of ∞ -categories*

$$\text{Fun}(N_\bullet^D(BDy), \mathcal{C}) \rightarrow \text{Fun}(N_{\leq 2}(Idem), \mathcal{C}).$$

Proof. Combine Theorem 8.5.9.5 with Corollary 4.5.5.19 (noting that ι is a monomorphism of simplicial sets). \square

Corollary 8.5.9.7. *Let \mathcal{C} be an ∞ -category containing an endomorphism $e : X \rightarrow X$. Then 0430 e is homotopy idempotent if and only if there is a functor of ∞ -categories $F : N_\bullet^D(BDy) \rightarrow \mathcal{C}$ satisfying $F(\bar{e}) = e$.*

Example 8.5.9.8. Let $Dy_{>0}$ denote the full subcategory of the Thompson groupoid Dy 0431 spanned by the intervals $[0, s]$ where $s > 0$. Note that the action of Dy on itself (via

concatenation) restricts to an action of Dy on the groupoid $Dy_{>0}$, and therefore determines a (strict) functor of 2-categories

$$BDy \rightarrow \{\text{Groupoids}\} \quad X \mapsto Dy_{>0}.$$

Passing to nerves, we obtain a functor of ∞ -categories

$$N_\bullet^D(BDy) \rightarrow \mathcal{S} \quad X \mapsto N_\bullet(Dy_{>0}),$$

which carries the 1-morphism \bar{e} of BDy to the homotopy idempotent endomorphism

$$N_\bullet(Dy_{>0}) \rightarrow N_\bullet(Dy_{>0}) \quad [0, s] \mapsto [0, 1] \circledast [0, s] = [0, 1 + s].$$

Note that, up to isomorphism, this coincides with the homotopy idempotent endomorphism constructed in Proposition 8.5.7.14; this follows from the observation that the diagram of categories

$$\begin{array}{ccc} B \text{Aut}_{Dy}([0, 1]) & \xrightarrow{\alpha} & B \text{Aut}_{Dy}([0, 1]) \\ \downarrow \sim & & \downarrow \sim \\ Dy_{>0} & \xrightarrow{[0, 1] \circledast} & Dy_{>0} \end{array}$$

commutes up to isomorphism (where the vertical maps are the inclusion functors and α is the homomorphism of Construction 8.5.7.13).

Our first goal is to reduce Theorem 8.5.9.5 to a more concrete statement about simplicial monoids.

- 0432 **Notation 8.5.9.9.** Let $N_{\leq 2}(\text{Idem})$ denote the simplicial set described in Example 8.5.8.3. By virtue of Proposition 2.4.4.3, we can choose a simplicial category \mathcal{C} and a morphism of simplicial sets $u : N_{\leq 2}(\text{Idem}) \rightarrow N_\bullet^{\text{hc}}(\mathcal{C})$ which exhibits \mathcal{C} as a simplicial path category for $N_{\leq 2}(\text{Idem})$. The morphism u carries the unique vertex \tilde{X} of $N_{\leq 2}(\text{Idem})$ to an object $X \in \mathcal{C}$. Set $E_\bullet = \text{Hom}_{\mathcal{C}}(X, X)_\bullet$, which we regard as a simplicial monoid. Evaluating the morphism u on the nondegenerate edge \tilde{e} of $N_{\leq 2}(\text{Idem})$, we obtain a morphism $e : X \rightarrow X$ in the category \mathcal{C} , which we can view as a vertex of the simplicial set E_\bullet . Evaluating the morphism u on the nondegenerate 2-simplex of $N_{\leq 2}(\text{Idem})$, we obtain an edge $h : e^2 \rightarrow e$ in the simplicial monoid E_\bullet .

Let $N_\bullet(Dy)$ denote the nerve of the Thompson groupoid. The concatenation functor of Notation 8.5.9.4 endows $N_\bullet(Dy)$ with the structure of a simplicial monoid. We let $B N_\bullet(Dy)$ denote the simplicial category given by delooping $N_\bullet(Dy)$ (Example 2.4.2.3), so that the homotopy coherent nerve of $B N_\bullet(Dy)$ can be identified with the Duskin nerve of the strict

2-category $B\text{Dy}$ (see Example 2.4.3.11). It follows that the partial idempotent ι of Notation 8.5.9.4 can be identified with a morphism from $N_{\leq 2}(\text{Idem})$ to $N_{\bullet}^{\text{hc}}(B N_{\bullet}(\text{Dy}))$, which factors unique as a composition

$$N_{\leq 2}(\text{Idem}) \xrightarrow{u} N_{\bullet}^{\text{hc}}(\mathcal{C}) \xrightarrow{N_{\bullet}^{\text{hc}}(F)} N_{\bullet}^{\text{hc}}(B N_{\bullet}(\text{Dy}))$$

for some simplicial functor $F : \mathcal{C} \rightarrow B N_{\bullet}(\text{Dy})$, which we can identify with a homomorphism of simplicial monoids

$$\varphi : E_{\bullet} = \text{Hom}_{\mathcal{C}}(X, X)_{\bullet} \xrightarrow{F} \text{Hom}_{B N_{\bullet}(\text{Dy})}(F(X), F(X))_{\bullet} = N_{\bullet}(\text{Dy}).$$

By construction, the homomorphism φ carries the vertex e to the object $[0, 1] \in \text{Dy}$, and the edge $h : e^2 \rightarrow e$ to the dyadic homeomorphism

$$[0, 1] \circledast [0, 1] = [0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2.$$

Remark 8.5.9.10. Using the universal property of the path category $\mathcal{C} = \text{Path}[N_{\leq 2}(\text{Idem})]_{\bullet}$, 0433 it is not difficult to see that E_{\bullet} is freely generated (as a simplicial monoid) by the vertex e and the edge $h : e^2 \rightarrow e$. In particular, the homomorphism of simplicial monoids $\varphi : E_{\bullet} \rightarrow N_{\bullet}(\text{Dy})$ is uniquely determined by the requirement that it carries e to the unit interval $[0, 1] \in \text{Dy}$ and h to the dyadic homeomorphism $x \mapsto x/2$.

We will deduce Theorem 8.5.9.5 from the following:

Proposition 8.5.9.11. *The homomorphism $\varphi : E_{\bullet} \rightarrow N_{\bullet}(\text{Dy})$ is a weak homotopy equivalence of simplicial sets.* 0434

Proof of Theorem 8.5.9.5 from Proposition 8.5.9.11. We wish to show that the partial idempotent

$$\iota : N_{\leq 2}(\text{Idem}) \rightarrow N_{\bullet}^D(B\text{Dy}) \simeq N_{\bullet}^{\text{hc}}(B N_{\bullet}(\text{Dy}))$$

is a categorical equivalence of simplicial sets. Since the category Dy is a groupoid, the simplicial monoid $N_{\bullet}(\text{Dy})$ is a Kan complex (Proposition 1.2.4.2). It follows that the simplicial category $B N_{\bullet}(\text{Dy})$ is locally Kan. Invoking Theorem [?], we are reduced to showing that ι induces a weak equivalence of simplicial categories $F : \text{Path}[N_{\leq 2}(\text{Idem})]_{\bullet} \rightarrow B N_{\bullet}(\text{Dy})$, in the sense of Definition 4.6.7.7. Write X for the unique object of the path category $\text{Path}[N_{\leq 2}(\text{Idem})]_{\bullet}$, so that $F(X)$ is the unique object of $B N_{\bullet}(\text{Dy})$. We are then reduced to showing that F induces a weak homotopy equivalence of simplicial monoids

$$\varphi : E_{\bullet} = \text{Hom}_{\text{Path}[N_{\leq 2}(\text{Idem})]}(X, X)_{\bullet} \rightarrow \text{Hom}_{B N_{\bullet}(\text{Dy})}(F(X), F(X)) = N_{\bullet}(\text{Dy}),$$

which follows from Proposition 8.5.9.11. □

We will deduce Proposition 8.5.9.11 from a more refined result, which characterizes the simplicial monoid E_\bullet up to categorical equivalence (rather than merely up to weak homotopy equivalence).

- 0435 **Notation 8.5.9.12.** Let m and n be nonnegative integers. We will say that a homeomorphism $f : [0, m] \xrightarrow{\sim} [0, n]$ is a *dyadic contraction* if, for every integer $0 \leq k < m$, the restriction of f to the closed interval $[k, k+1]$ is given by the formula $f(x) = (x+a)/2^b$ for some integers a and b with $b \geq 0$.

We let Dy_+ denote the subcategory of the Thompson groupoid Dy whose objects are intervals of the form $[0, m]$, where m is a nonnegative integer, and whose morphisms are dyadic contractions.

- 0436 **Exercise 8.5.9.13.** Show that the subcategory $\text{Dy}_+ \subset \text{Dy}$ is well-defined: that is, the collection of dyadic contractions is closed under composition.

- 0437 **Warning 8.5.9.14.** The category Dy_+ of Notation 8.5.9.12 is not a groupoid. In fact, every isomorphism in the category Dy_+ is an identity morphism.

- 0438 **Proposition 8.5.9.15.** *The homomorphism $\varphi : E_\bullet \rightarrow N_\bullet(\text{Dy})$ factors as a composition*

$$E_\bullet \xrightarrow{\varphi_+} N_\bullet(\text{Dy}_+) \subset N_\bullet(\text{Dy}),$$

where φ_+ is inner anodyne.

Proof of Proposition 8.5.9.11 from Proposition 8.5.9.15. By virtue of Proposition 8.5.9.15, it will suffice to show that the inclusion of categories $\text{Dy}_+ \hookrightarrow \text{Dy}$ induces a weak homotopy equivalence of simplicial sets $U : N_\bullet(\text{Dy}_+) \hookrightarrow N_\bullet(\text{Dy})$. Using Quillen's Theorem A (Example 7.2.3.3), we are reduced to proving the following: for every object $[0, s] \in \text{Dy}$, the category $\mathcal{A} = \text{Dy}_+ \times_{\text{Dy}} \text{Dy}_{[0,s]}$ has weakly contractible nerve. We can describe the category \mathcal{A} more concretely as follows:

- The objects of \mathcal{A} are dyadic homeomorphisms $f : [0, s] \xrightarrow{\sim} [0, m]$, where m is an integer.
- Let $f : [0, s] \xrightarrow{\sim} [0, m]$ and $g : [0, s] \xrightarrow{\sim} [0, n]$ be dyadic homeomorphisms. Then there is a morphism from f to g (in the category \mathcal{A}) if and only if the homeomorphism $(g \circ f^{-1}) : [0, m] \rightarrow [0, n]$ is a dyadic contraction. If this condition is satisfied, then the morphism is unique.

It follows that the category \mathcal{A} can be viewed as a partially ordered set. Moreover, every finite subset of \mathcal{A} has a lower bound, given by the dyadic homeomorphism

$$[0, s] \xrightarrow{\sim} [0, 2^k s] \quad x \mapsto 2^k x$$

for some integer $k \gg 0$. It follows that the category \mathcal{A}^{op} is filtered (Exercise 7.2.4.2), so that $N_\bullet(\mathcal{A})$ is weakly contractible by virtue of Proposition 7.2.4.9. \square

The proof of Proposition 8.5.9.15 will require some preliminaries.

Notation 8.5.9.16. Let $n \geq 0$ be an integer and let J be a subset of $\{1, 2, \dots, n\}$. We 0439 let $b_J : [0, n] \xrightarrow{\sim} [0, n + |J|]$ be the dyadic homeomorphism which is characterized by the following requirement: for every integer $1 \leq j \leq n$, the function b_J is differentiable at every point $x \in (j - 1, j)$, with derivative given by the formula

$$b'_J(x) = \begin{cases} 1 & \text{if } j \notin J \\ 2 & \text{if } j \in J. \end{cases}$$

Note that, if this condition is satisfied, then the inverse homeomorphism $b_J^{-1} : [0, n + |J|] \xrightarrow{\sim} [0, n]$ is a dyadic contraction. We say that a dyadic contraction is *elementary* if it has the form b_J^{-1} , for some integer $n \geq 0$ and some subset $J \subseteq \{1, 2, \dots, n\}$.

Remark 8.5.9.17. Let $f : [0, m] \xrightarrow{\sim} [0, n]$ be a dyadic contraction. The following conditions 043A are equivalent:

- The dyadic contraction f is elementary, in the sense of Notation 8.5.9.16.
- For every point $x \in [0, m]$ where f is differentiable, the derivative $f'(x)$ is either 1 or 1/2.
- The dyadic contraction f can be written as a concatenation $f_1 \circ f_2 \circ \dots \circ f_n$, where each f_i is either the identity function $\text{id} : [0, 1] \xrightarrow{\sim} [0, 1]$ or the homeomorphism

$$H : [0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2.$$

Lemma 8.5.9.18. The collection of elementary dyadic contractions is a class of short 043B morphisms for the ∞ -category $N_{\bullet}(\text{Dy}_+)$, in the sense of Definition 6.2.5.4.

Proof. Let S denote the collection of all elementary dyadic contractions. We verify that S satisfies conditions (1) through (4) of Definition 6.2.5.4:

- (1) For every integer $n \geq 0$, the identity morphism $\text{id} : [0, n] \xrightarrow{\sim} [0, n]$ is an elementary dyadic contraction. This is immediately from the definitions.
- (2) Suppose we are given a commutative diagram of dyadic contractions

$$\begin{array}{ccc} & [0, m] & \\ f \nearrow & & \searrow g \\ [0, k] & \xrightarrow{h} & [0, n]. \end{array}$$

Assume that g and h are elementary; we wish to show that f is also elementary (in fact, the assumption that g is elementary will not be needed). Choose a point $x \in [0, k]$ at which f is differentiable; we wish to show that $f'(x) \geq 1/2$ (see Remark 8.5.9.17). Replacing x by a nearby point if necessary, we may assume that g is differentiable at the point $y = f(x)$. Since g is a dyadic contraction and h is an elementary dyadic contraction, we have $g'(y) \leq 1$ and $h'(x) \geq 1/2$. Applying the chain rule, we obtain inequalities $f'(x) \geq f'(x) \cdot g'(y) = h'(x) \geq 1/2$.

- (3) Let $f : [0, m] \xrightarrow{\sim} [0, n]$ be a dyadic contraction. We wish to show that f admits an S -optimal factorization (in the sense of Definition 6.2.5.1). Let P denote the collection of all subsets $\{1, 2, \dots, n\}$ having the property that the composition $(b_J \circ f) : [0, m] \rightarrow [0, n + |J|]$ is a dyadic contraction; here b_J denotes the dyadic homeomorphism introduced in Notation 8.5.9.16. Unwinding the definitions, we can identify P with the set of factorizations $f = s \circ g$, where g is a dyadic contraction and s is an elementary dyadic contraction (the identification carries a set $J \in P$ to the pair $(s, g) = (b_J^{-1}, b_J \circ f)$). Under this identification, a factorization $f = s \circ g$ is S -optimal if and only if J is a largest element of P . We conclude by observing that P has a largest element J_{\max} , given by the collection of those integers $j \in \{1, 2, \dots, n\}$ having the property that the inverse homeomorphism f^{-1} has derivative ≥ 2 at every point $x \in [j-1, j]$ where f^{-1} is differentiable (alternatively, J_{\max} can be described as the set of integers $1 \leq j \leq n$ which satisfy $f^{-1}(j) > f^{-1}(j-1) + 1$).
- (4) Let $f : [0, m] \rightarrow \sim[0, n]$ be a dyadic contraction. Let us define the *length of f* to be the smallest nonnegative integer k such that $f'(x) \geq 1/2^k$ for every point $x \in [0, m]$ where f is differentiable. We claim that, if this condition is satisfied, then f can be written as a composition $s_1 \circ s_2 \circ \dots \circ s_k$, where each s_i is an elementary dyadic contraction. Our proof proceeds by induction on k . If $k = 0$, then f is an identity morphism and there is nothing to prove. Let us therefore assume that $k > 0$, and let $f = s_1 \circ g$ be an S -optimal factorization of f . We claim that g can be written as a composition of elementary contractions $s_2 \circ \dots \circ s_k$. By virtue of our inductive hypothesis, it will suffice to show that g has length $k - 1$, which follows from the proof of (3).

□

Proof of Proposition 8.5.9.15. Let $N_\bullet(\text{Dy}_+)^{\text{short}}$ denote the simplicial subset of $N_\bullet(\text{Dy}_+)$ whose m -simplices are diagrams of dyadic contractions $\sigma :$

$$[0, n_0] \xrightarrow{\sim} [0, n_1] \xrightarrow{\sim} \dots \xrightarrow{\sim} [0, n_m]$$

for which the composite map $[0, n_0] \xrightarrow{\sim} [0, n_m]$ is an elementary dyadic contraction (note that this guarantees that each intermediate composition $[0, n_i] \xrightarrow{\sim} [0, n_j]$ is also elementary). It

follows from Lemma 8.5.9.18 and Theorem 6.2.5.10 that the inclusion map $N_\bullet(Dy_+)^{\text{short}} \hookrightarrow N_\bullet(Dy_+)$ is inner anodyne. We will complete the proof by showing that the morphism $\varphi : E_\bullet \rightarrow N_\bullet(Dy)$ induces of Notation 8.5.9.9 induces an isomorphism of E_\bullet with the simplicial subset $N_\bullet(Dy_+)^{\text{short}} \subseteq N_\bullet(Dy)$.

Fix an integer $m \geq 0$, so that φ induces a monoid homomorphism $\varphi_m : E_m \rightarrow N_m(Dy)$. We wish to show that φ_m is a monomorphism, whose image is the subset $N_m(Dy_+)^{\text{short}} \subseteq N_m(Dy)$. Note that $N_m(Dy_+)^{\text{short}}$ is closed under concatenation, and therefore inherits the structure of a monoid. Let us say that an m -simplex σ of $N_\bullet(Dy_+)^{\text{short}}$ is *indecomposable* if it corresponds to a diagram of dyadic contractions

$$[0, n_0] \xrightarrow{\sim} [0, n_1] \xrightarrow{\sim} \cdots \xrightarrow{\sim} [0, n_m]$$

with $n_m = 1$. In this case, we define the *index* of σ to be the smallest integer k such that $n_k = 1$. For every integer $0 \leq k \leq m$, the simplicial set $N_\bullet(Dy_+)^{\text{short}}$ has a unique indecomposable m -simplex σ_k of index k , which can be described explicitly as follows:

- If $k = 0$, then σ_k is the diagram of identity morphisms

$$[0, 1] \xrightarrow{\text{id}} [0, 1] \xrightarrow{\text{id}} [0, 1] \xrightarrow{\text{id}} \cdots \xrightarrow{\text{id}} [0, 1].$$

- If $k > 0$, then the diagram σ_k has the form

$$[0, 2] \xrightarrow{\text{id}} \cdots \xrightarrow{\text{id}} [0, 2] \xrightarrow{x \mapsto x/2} [0, 1] \xrightarrow{\text{id}} \cdots \xrightarrow{\text{id}} [0, 1].$$

Moreover, every m -simplex of $N_\bullet(Dy_+)^{\text{short}}$ can be written uniquely as a concatenation of indecomposable m -simplices of $N_\bullet(Dy_+)^{\text{short}}$: that is, $N_m(Dy_+)^{\text{short}}$ can be identified with the free monoid generated by the set $\{\sigma_0, \sigma_1, \dots, \sigma_m\}$.

Let $\mathcal{C}_\bullet = \text{Path}[N_{\leq 2}(\text{Idem})]_\bullet$ denote the simplicial path category of $N_{\leq 2}(\text{Idem})$. Theorem 2.4.4.10 supplies an identification of \mathcal{C}_m with the path category $\text{Path}[G]$, where G is a directed graph having a single vertex X (corresponding to the unique vertex of the simplicial set $N_{\leq 2}(\text{Idem})$). It follows that $E_m = \text{Hom}_{\mathcal{C}_m}(X, X)$ can be identified with the free monoid generated by the set of edges $\text{Edge}(G)$ (Example 1.2.6.3). It will therefore suffice to prove the following:

- $(*_m)$ The monoid homomorphism φ_m induces a bijection from the set $\text{Edge}(G)$ to the collection $\{\sigma_0, \sigma_1, \dots, \sigma_m\}$ of indecomposable m -simplices of $N_\bullet(Dy_+)^{\text{short}}$.

To prove $(*_m)$, we recall that $\text{Edge}(G)$ can be identified with the set of pairs (τ, \vec{I}) , where τ is a nondegenerate simplex of $N_{\leq 2}(\text{Idem})$ of dimension $n > 0$ and $\vec{I} = (I_0 \supseteq I_1 \supseteq \cdots \supseteq I_{m-1} \supseteq I_m)$ is a chain of subsets of $[n] = \{0 < 1 < \cdots < n\}$ satisfying $I_0 = [n]$ and $I_m = \{0, n\}$. We consider two possibilities:

- The simplex τ has dimension $n = 1$. In this case, both τ and \vec{I} are uniquely determined. We claim that the homomorphism φ_m carries (τ, \vec{I}) to the indecomposable m -simplex σ_0 . To prove this, we can invoke our assumption that φ is a morphism of simplicial monoids to reduce to the case $m = 0$, in which case it reduces to the identity $\varphi(e) = [0, 1]$ of Remark 8.5.9.10.
- The simplex τ has dimension $n = 2$. In this case, τ is again uniquely determined, and the chain \vec{I} is determined by a single integer $1 \leq k \leq m$, given by the formula $k = \min\{j : I_j = \{0, 2\}\}$. We claim that the homomorphism φ_m carries (τ, \vec{I}) to the indecomposable m -simplex σ_k . To prove this, we can again invoke our assumption that φ is a morphism of simplicial monoids to reduce to the case $m = 1$, in which case it reduces to the assertion that φ carries the edge $h : e^2 \rightarrow e$ of E_\bullet to the dyadic contraction

$$[0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2;$$

see Remark 8.5.9.10.

□

8.6 Conjugate and Dual Fibrations

04C0 Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial ∞ -categories. For each object $C \in \mathcal{C}$, we let \mathcal{E}_C denote the fiber $U^{-1}\{C\} = \{C\} \times_{\mathcal{C}} \mathcal{E}$. In §5.2.5, we showed that this construction determines a functor

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}_C,$$

which we refer to as the *(covariant) homotopy transport representation* of the cocartesian fibration U (Construction 5.2.5.2). Similarly, if $U' : \mathcal{E}' \rightarrow \mathcal{C}'$ is a cartesian fibration of ∞ -categories, then the assignment $C \mapsto \mathcal{E}'_C$ determines a functor

$$\mathrm{hTr}_{\mathcal{E}'/\mathcal{C}'} : \mathrm{h}\mathcal{C}'^{\mathrm{op}} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}'_C$$

which we refer to as the *(contravariant) homotopy transport representation* of the cartesian fibration U (Construction 5.2.5.7). There is an obvious relationship between these constructions. If $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration, then the opposite map $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration, and the homotopy transport representations $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}$ and $\mathrm{hTr}_{\mathcal{E}^{\mathrm{op}}/\mathcal{C}^{\mathrm{op}}}$ are interchanged by composing with the automorphism

$$\sigma : \mathrm{hQCat} \rightarrow \mathrm{hQCat} \quad \mathcal{A} \mapsto \mathcal{A}^{\mathrm{op}}.$$

In this section, we show that the passage from a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ to the opposite cartesian fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ can be broken into two steps:

- To every cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, we will associate another cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ which we refer to as the *cocartesian dual* of U , whose (covariant) homotopy transport representation is given (up to isomorphism) by the construction

$$\mathrm{hTr}_{\mathcal{E}^\vee / \mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{h}\mathrm{QCat} \quad C \mapsto \mathcal{E}_C^{\mathrm{op}}.$$

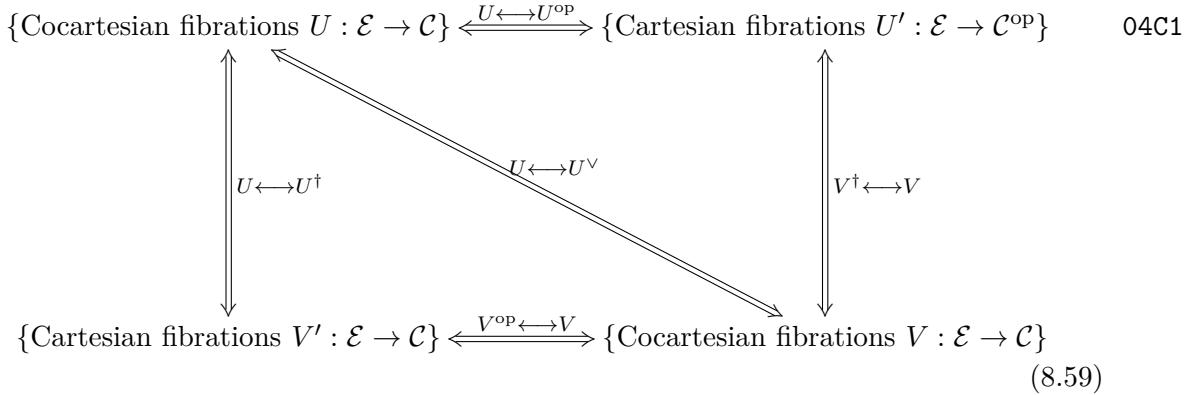

In particular, each fiber of U^\vee is equivalent to the *opposite* of the corresponding fiber of U .

- To every cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, we will associate a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\mathrm{op}}$ which we refer to as the *cartesian conjugate* of U , whose (contravariant) homotopy transport representation is given (up to isomorphism) by the construction

$$\mathrm{hTr}_{\mathcal{E}^\dagger / \mathcal{C}^{\mathrm{op}}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{h}\mathrm{QCat} \quad C \mapsto \mathcal{E}_C.$$

In particular, each fiber of U^\dagger is equivalent to the corresponding fiber of U .

For a fixed ∞ -category (or simplicial set) \mathcal{C} , the relationships between these constructions is summarized by the following diagram:

If $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration of ∞ -categories, then the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ is easy to describe at the level of simplicial sets (see §1.3.2). For the dual and conjugate fibrations U^\vee and U^\dagger , this is somewhat more subtle. For example, the passage from a simplicial set \mathcal{E} to its opposite $\mathcal{E}^{\mathrm{op}}$ is involutive, in the sense that there is a canonical isomorphism $\mathcal{E} \simeq (\mathcal{E}^{\mathrm{op}})^{\mathrm{op}}$ (in fact, if we adhere strictly to the convention of Construction 1.3.2.2, then the simplicial sets \mathcal{E} and $(\mathcal{E}^{\mathrm{op}})^{\mathrm{op}}$ are *identical*). It is therefore natural to hope for the passage from a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ to its dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ to have a similar property: heuristically, \mathcal{E}^\vee is obtained from \mathcal{E} by applying the preceding construction to each fiber of U . Unfortunately, it does not seem possible to give a construction where this property is visible at the level of simplicial sets: the best we can expect is that cocartesian

duality is involutive *up to equivalence*, in the sense that the double dual $(U^\vee)^\vee : (\mathcal{E}^\vee)^\vee \rightarrow \mathcal{C}$ is equivalent to the original cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ in some natural way. To address this point, it will be convenient to view duality as a *relationship* which can exist between cocartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ over the same base, rather than as an *operation* which takes U as input and produces U^\vee as an output. Similarly, we will view conjugacy as a relationship which can exist between a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ and a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ over the opposite base. Our first goal will be to describe these relationships more precisely:

- Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. We will say that a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is a *cartesian conjugate* of U if there exists a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ & \searrow & \swarrow U \\ & \mathcal{C} & \end{array}$$

satisfying two axioms (Definition 8.6.1.1), one of which requires that T restricts to an equivalence of ∞ -categories $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$ for each vertex $C \in \mathcal{C}$. In §8.6.1, we develop the properties of this definition and give some examples.

- Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. We say that a cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is a *cocartesian dual* of U if there exists a left fibration of simplicial sets $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ satisfying two axioms (Definition 8.6.3.1), one of which requires that for each vertex $C \in \mathcal{C}$, the induced map $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$ is a balanced coupling of ∞ -categories (Definition 8.2.6.1). This guarantees in particular that \mathcal{E}_C^\vee is equivalent to the opposite ∞ -category $\mathcal{E}_C^{\text{op}}$ (Corollary 8.2.6.6). In §8.6.3, we develop the properties of this definition and give some examples.

Our next goal is to show that, if $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets, then it admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, which are uniquely determined up to equivalence. In each case, we will prove existence (and ultimately uniqueness) using explicit constructions at the level of simplicial sets. To fix ideas, let us first assume that $\mathcal{C} = \Delta^0$. In this case, constructing a dual of cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is tantamount to constructing an ∞ -category \mathcal{E}^\vee which is equivalent to the opposite of \mathcal{E} . We consider three different solutions to this problem:

- We can take \mathcal{E}^\vee to be the opposite ∞ -category \mathcal{E}^{op} itself, given concretely by Construction 1.3.2.2.

- (b) We can take \mathcal{E}^\vee to be the ∞ -category of corepresentable functors $\text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S})$. This is equivalent to \mathcal{E}^{op} by virtue of the ∞ -categorical version of Yoneda's lemma (Theorem 8.3.3.13), at least if \mathcal{E} is locally small.
- (c) We can take \mathcal{E}^\vee to be the ∞ -category $\text{Cospan}^{\text{iso,all}}(\mathcal{E})$ of Variant 8.1.7.14, whose morphisms are given by cospans $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category \mathcal{E} where f is required to be an isomorphism. By virtue of Proposition 8.1.7.6, this is also equivalent to the ∞ -category \mathcal{E}^{op} .

Each of these approaches can be adapted to more general situations. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets.

- Assume that \mathcal{C} is an ∞ -category. In §8.6.2, we define a fibration

$$\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$$

and show that it is a cartesian conjugate of U (Proposition 8.6.2.3). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the original ∞ -category \mathcal{E} ; consequently, after passing to opposite ∞ -categories, it can be viewed as a relative version of construction (a).

- Assume that, for each vertex $C \in \mathcal{C}$, the ∞ -category \mathcal{E}_C is locally small. In §8.6.4, we define a fibration $\text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}) \rightarrow \mathcal{C}$ and show that it is a cocartesian dual of U (Proposition 8.6.4.8). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the ∞ -category of corepresentable functors $\text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S})$; consequently, it can be viewed as a relative version of construction (b).
- Let $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C})$ denote the fiber product $\mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{W,\text{all}}(\mathcal{E})$, where W denotes the collection of all U -cocartesian edges of \mathcal{E} . In §8.6.5, we show that the projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}$ is a cocartesian dual of U (Theorem 8.6.5.6). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the ∞ -category $\text{Cospan}^{\text{iso,all}}(\mathcal{E})$; consequently, it can be viewed as a relative version of construction (c).

Remark 8.6.0.1. Ultimately, each of the constructions described above gives rise to 04C2 essentially the same object. However, it will be useful to consider all three, since each reveals different facets of the overall picture. Fix a cocartesian fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$.

- The construction of §8.6.2 can be used to show that U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ (Corollary 8.6.2.4), which is uniquely up to equivalence if \mathcal{C} is an ∞ -category (Corollary 8.6.2.9). However, it is not obvious that the opposite fibration $U^{\dagger,\text{op}} : \mathcal{E}^{\dagger,\text{op}} \rightarrow \mathcal{C}$ is a cocartesian dual of U (in the sense of Definition 8.6.3.1).

- The construction of §8.6.4 can be used to show that U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, which is uniquely determined up to equivalence (Theorem 8.6.4.1). However, it is not obvious that the opposite fibration $U^{\vee,\text{op}} : \mathcal{E}^{\vee,\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian conjugate of U (in the sense of Definition 8.6.1.1).
- The construction of §8.6.5 produces a specific example of a fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ which is a cocartesian dual of U . From this perspective, it is not obvious that the cocartesian dual is unique. However, it enjoys another form of uniqueness: in §8.6.6, we show that every cartesian conjugate of U is equivalent to the fibration $U^{\vee,\text{op}}$ (Proposition 8.6.6.6). Combining this with the *existence* of cartesian conjugates (obtained from §8.6.2) and the *uniqueness* of cocartesian duals (obtained from §8.6.4), we deduce that the diagram (8.59) is commutative: that is, a fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian conjugate of U if and only if $U^{\dagger,\text{op}} : \mathcal{E}^{\dagger,\text{op}} \rightarrow \mathcal{C}$ is a cocartesian dual of U (Proposition 8.6.6.1).

04C3 **Remark 8.6.0.2** (Duality via Transport Representations). Let \mathcal{QC} denote the ∞ -category of small ∞ -categories (Construction 5.6.4.1). Then \mathcal{QC} admits an autoequivalence $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$, given on objects by the formula $\sigma(\mathcal{A}) = \mathcal{A}^{\text{op}}$ (see Construction 8.6.7.6). Recall that an (essentially small) cocartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$ is determined, up to equivalence, by a functor $\text{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}$, which we refer to as the *covariant transport representation* of U (Definition 5.7.5.1). In §8.6.7, we show that a cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is a cocartesian dual of U if and only if its covariant transport representation is isomorphic to the composition $\mathcal{C} \xrightarrow{\text{Tr}_{\mathcal{E}/\mathcal{C}}} \mathcal{QC} \xrightarrow{\sigma} \mathcal{QC}$ (Proposition 8.6.7.12). This gives another construction of the cocartesian dual of U (albeit one which is cumbersome to work with).

04C4 **Remark 8.6.0.3.** The commutativity of the diagram (8.59) is not immediately obvious: the notions of cartesian conjugacy and cocartesian duality have separate definitions that are *a priori* unrelated to one another. We will maintain this separation in our exposition: the portions of this section which discuss conjugate fibrations (§8.6.1 and §8.6.2) can be read independently of those which discuss dual fibrations (§8.6.3, §8.6.4, §8.6.5, and §8.6.7). Only in §8.6.6 will we consider both notions simultaneously.

04C5 **Remark 8.6.0.4.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. The construction of the dual fibration $U^\vee : \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}$ studied in §8.6.5 appears in work of Barwick, Glasman, and Nardin; see [3].

8.6.1 Conjugate Fibrations

04C6 Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Our goal in this section is to formalize the requirement that U and U^\dagger

have “the same fibers”: that is, that there exists a family of equivalences $\{T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C\}_{C \in \mathcal{C}}$ which in some sense depend functorially on the vertex $C \in \mathcal{C}$.

Definition 8.6.1.1 (Conjugate Fibrations). Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Let $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ and $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ be the projection maps of Notation 8.1.1.6. We say that a morphism of simplicial sets $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ exhibits U^\dagger as a cartesian conjugate of U if the following conditions are satisfied:

(0) The diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \xrightarrow{\lambda_+} & \mathcal{C} \end{array}$$

is commutative.

- (1) For every vertex $C \in \mathcal{C}$, restricting T to the inverse image of the vertex $\text{id}_C \in \text{Tw}(\mathcal{C})$ determines an equivalence of ∞ -categories $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$.
- (2) Let e be an edge of the simplicial set $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. If the image of e in \mathcal{E}^\dagger is U^\dagger -cartesian, then $T(e)$ is a U -cocartesian edge of \mathcal{E} .

We say that U^\dagger is a cartesian conjugate of U if there exists a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits U^\dagger as a cartesian conjugate of U .

Warning 8.6.1.2 (Symmetry). Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. In §8.6.6, we will show that U^\dagger is a cartesian conjugate of U if and only if U^{op} is a cocartesian conjugate of $U^{\dagger, \text{op}}$ (Corollary 8.6.6.2). Beware that this is not obvious from Definition 8.6.1.1.

Example 8.6.1.3. Let \mathcal{E} and \mathcal{E}^\dagger be ∞ -categories. Set $\mathcal{C} = \Delta^0$ and let $U : \mathcal{E} \rightarrow \mathcal{C}^{\text{op}}$ and $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}$ denote the projection maps. Then a functor

$$T : \mathcal{E}^\dagger \simeq \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

exhibits U^\dagger as a cartesian conjugate of U if and only if it is an equivalence of ∞ -categories. In particular, U^\dagger is a cartesian conjugate of U if and only if the ∞ -category \mathcal{E}^\dagger is equivalent to \mathcal{E} .

04CA **Remark 8.6.1.4** (Base Change). Let $F : \mathcal{C}' \rightarrow \mathcal{C}$ be a morphism of simplicial sets. Suppose we are given pullback squares

$$\begin{array}{ccc} \mathcal{E}'^\dagger & \xrightarrow{U'^\dagger} & \mathcal{C}'^{\text{op}} \\ \downarrow & & \downarrow F^{\text{op}} \\ \mathcal{E}^\dagger & \xrightarrow{U^\dagger} & \mathcal{C}^{\text{op}} \\ & & \\ \mathcal{E}' & \xrightarrow{U'} & \mathcal{C}' \\ \downarrow & & \downarrow F \\ \mathcal{E} & \xrightarrow{U} & \mathcal{C}, \end{array}$$

where U^\dagger is a cartesian fibration and U is a cocartesian fibration. If $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ is a morphism which exhibits U^\dagger as a cartesian conjugate of U , then the induced map $T' : \mathcal{E}'^\dagger \times_{\mathcal{C}'^{\text{op}}} \text{Tw}(\mathcal{C}') \rightarrow \mathcal{E}'$ exhibits U'^\dagger as a cartesian conjugate of U' .

In the situation of Definition 8.6.1.1, we can regard condition (2) as a formulation of the requirement that the functor $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$ depends functorially on the vertex $C \in \mathcal{C}$. This heuristic can be articulated more precisely as follows:

04CB **Proposition 8.6.1.5.** *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Let $e : C \rightarrow C'$ be an edge of \mathcal{C} , and let*

$$e^* : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_{C'}^\dagger \quad e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$$

be functors given by contravariant and covariant transport along e for the fibrations U^\dagger and U , respectively. If $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ is a morphism which satisfies conditions (0) and (2) of Definition 8.6.1.1, then the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E}_C^\dagger & \xrightarrow{e^*} & \mathcal{E}_{C'}^\dagger \\ \downarrow T_C & & \downarrow T_{C'} \\ \mathcal{E}_C & \xrightarrow{e_!} & \mathcal{E}_{C'} \end{array}$$

commutes up to isomorphism.

Proof. The restriction of T to the inverse image of the vertex $\{e\} \subseteq \text{Tw}(\mathcal{C})$ determines a functor of ∞ -categories $T_e : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_{C'}$. To complete the proof, it will suffice to verify the following pair of assertions:

- (a) The functor T_e is isomorphic to the composition $T_{C'} \circ e^*$.
- (b) The functor T_e is isomorphic to the composition $e_! \circ T_C$.

We begin by proving (a). Choose a diagram

$$\begin{array}{ccc} \mathcal{E}_C^\dagger \times \Delta^1 & \xrightarrow{H} & \mathcal{E}^\dagger \\ \downarrow & & \downarrow U^\dagger \\ \Delta^1 & \xrightarrow{e} & \mathcal{C}^{\text{op}} \end{array}$$

which witnesses $e^* = H_{\mathcal{E}_C^\dagger \times \{0\}}$ as given by contravariant transport along e (see Definition 5.2.2.14). Let $e_L : \text{id}_C \rightarrow e$ and $e_R : \text{id}_{C'} \rightarrow e$ denote the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6, and let \tilde{H} denote the product morphism

$$\mathcal{E}_C^\dagger \times \Delta^1 \xrightarrow{H \times e_R} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}).$$

Then the composition $T \circ \tilde{H}$ can be regarded as a natural transformation from the functor $T_{C'} \circ e^*$ to T_e . For each object X of the ∞ -category \mathcal{E}_C^\dagger , the restriction $H|_{\{X\} \times \Delta^1}$ is a U^\dagger -cartesian edge of \mathcal{E}^\dagger . Using condition (2) of Definition 8.6.1.1, we conclude that $(T \circ \tilde{H})|_{\{X\} \times \Delta^1}$ is a U -cocartesian edge of \mathcal{E} lying over the degenerate edge $\text{id}_{C'}$ of \mathcal{C} , and is therefore an isomorphism in the ∞ -category $\mathcal{E}_{C'}$ (Proposition 5.1.4.11). Applying Theorem 4.4.4.4, we conclude that $T \circ \tilde{H}$ is an isomorphism of functors from $T_{C'} \circ e^*$ to T_e .

We now prove (b). Let H' denote the composite map

$$\mathcal{E}_C^\dagger \times \Delta^1 \xrightarrow{\text{id} \times e_L} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \xrightarrow{T} \mathcal{E},$$

We then have a commutative diagram

$$\begin{array}{ccc} \mathcal{E}_C^\dagger \times \Delta^1 & \xrightarrow{H'} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \Delta^1 & \xrightarrow{e} & \mathcal{C}. \end{array}$$

Condition (2) of Definition 8.6.1.1 guarantees that, for each object $X \in \mathcal{E}_C^\dagger$, the restriction $H'|_{\{X\} \times \Delta^1}$ is a U -cocartesian edge of \mathcal{E} . It follows that H' determines an isomorphism of $T_e = H'|_{\mathcal{E}_C^\dagger \times \{1\}}$ with the composition $e_! \circ (H'|_{\mathcal{E}_C^\dagger \times \{0\}}) = e_! \circ T_C$. \square

Corollary 8.6.1.6. *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration 04CC having homotopy transport representation $\text{hTr}_{\mathcal{E}/\mathcal{C}} : \text{h}\mathcal{C} \rightarrow \text{hQCat}$ (Construction 5.2.5.2), and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration having homotopy transport representation $\text{hTr}_{\mathcal{E}^\dagger/\mathcal{C}^{\text{op}}} : \text{h}\mathcal{C} \rightarrow \text{hQCat}$ (Construction 5.2.5.7). If $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ exhibits U^\dagger as a cartesian conjugate of U , then T induces an isomorphism of functors $\text{hTr}_{\mathcal{E}^\dagger/\mathcal{C}^{\text{op}}} \xrightarrow{\sim} \text{hTr}_{\mathcal{E}/\mathcal{C}}$, carrying each vertex $C \in \mathcal{C}$ to (the isomorphism class of) the equivalence $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$.*

04CD **Corollary 8.6.1.7.** *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. If U^\dagger is a cartesian conjugate of U , then the homotopy transport representations*

$$\text{hTr}_{\mathcal{E}^\dagger / \mathcal{C}^{\text{op}}}, \text{hTr}_{\mathcal{E} / \mathcal{C}} : \text{h}\mathcal{C} \rightarrow \text{hQCat}$$

are isomorphic.

We now give some concrete examples of conjugate fibrations.

04CE **Proposition 8.6.1.8** (Conjugates of Left Fibrations). *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets. Then:*

- (a) *The map $H : \text{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ is a trivial Kan fibration of simplicial sets.*
- (b) *Let T_0 be a section of H , and let $T : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ be the composition of T_0 with the projection map $\text{Tw}(\mathcal{E}) \rightarrow \mathcal{E}$. Then T exhibits the opposite fibration $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ as a cartesian conjugate of U .*

Proof. Note that the morphism H factors as a composition

$$\text{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}),$$

where the map on the left is a left fibration by virtue of Proposition 8.1.1.15, and the map on the right is pullback of U (and is therefore also a left fibration). It follows that H is a left fibration (Remark 4.2.1.11). To prove (a), it will suffice to show that every fiber of H is a contractible Kan complex (Proposition 4.4.2.14). For this, we may assume without loss of generality that $\mathcal{C} = \Delta^0$. In this case, \mathcal{E} is a Kan complex (Proposition 4.4.2.1) and we can identify H with the projection map $\text{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\text{op}}$, which is a trivial Kan fibration by virtue of Corollary 8.1.2.3.

Let $T : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ be as in (b); we wish to show that T satisfies conditions (0), (1), and (2) of Definition 8.6.1.1. Condition (0) follows from the commutativity of the diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{E}) & \xrightarrow{\quad} & \mathcal{E} \\ \downarrow H & & \downarrow U \\ \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{\quad} & \text{Tw}(\mathcal{C}) \xrightarrow{\quad} \mathcal{C}, \end{array}$$

and condition (2) is vacuous (our assumption that U is a left fibration guarantees that every edge of \mathcal{E} is U -cocartesian; see Example 5.1.1.3). To verify condition (1), we may again assume that $\mathcal{C} = \Delta^0$, in which case the desired result follows from the observation that the projection maps $\mathcal{E}^{\text{op}} \leftarrow \text{Tw}(\mathcal{E}) \rightarrow \mathcal{E}$ are homotopy equivalences of Kan complexes (see Corollary 8.1.2.3). \square

Construction 8.6.1.9 (Conjugacy for Categories of Elements). Let \mathcal{C} be a category, let \mathbf{Cat} denote the 2-category of (small) categories, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories. Let

$$\int^{\mathcal{C}^{\text{op}}} \mathcal{F} \quad \int_{\mathcal{C}} \mathcal{F}$$

denote the contravariant and covariant categories of elements of \mathcal{F} , respectively (see Definitions 5.7.1.4 and 5.7.1.1). Recall that objects of either category can be identified with pairs (C, X) , where C is an object of \mathcal{C} and X is an object of the category $\mathcal{F}(C)$. However, morphisms are defined differently:

- A morphism from (C, X) to (D, Y) in the category $\int_{\mathcal{C}} \mathcal{F}$ is a pair (f, u) where $f : C \rightarrow D$ is a morphism in the category \mathcal{C} and $u : \mathcal{F}(f)(X) \rightarrow Y$ is a morphism in the category $\mathcal{F}(D)$.
- A morphism from (C, X) to (D, Y) in the category $\int^{\mathcal{C}^{\text{op}}} \mathcal{F}$ is a pair (g, v) , where $g : D \rightarrow C$ is a morphism in the category \mathcal{C} , and $v : X \rightarrow \mathcal{F}(g)(Y)$ is a morphism in the category $\mathcal{F}(C)$.

Let us identify the objects of the fiber product $(\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with pairs $(s : C' \rightarrow C, X)$, where $s : C' \rightarrow C$ is a morphism in \mathcal{C} and X is an object of the category $\mathcal{F}(C')$. We define a functor T as follows:

$$T : (\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \int_{\mathcal{C}} \mathcal{F}$$

as follows:

- On objects, T is given by the formula $T(s : C' \rightarrow C, X) = (C, \mathcal{F}(s)(X))$.
- Let $(s : C' \rightarrow C, X)$ and $(t : D' \rightarrow D, Y)$ be objects of the category $(\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. Unwinding the definitions, we see that a morphism from $(s : C' \rightarrow C, X)$ to $(t : D' \rightarrow D, Y)$ can be identified with triples (f, f', u) , where $f : C \rightarrow D$ and $f' : D' \rightarrow C'$ are morphisms in \mathcal{C} satisfying $t = f \circ s \circ f'$, and $u : X \rightarrow \mathcal{F}(f')(Y)$ is a morphism in the category $\mathcal{F}(C')$. In this case, we define $T(f, f', u)$ to be the morphism $(f, v) : (C, \mathcal{F}(s)(X)) \rightarrow (D, \mathcal{F}(t)(Y))$, where v is the morphism in $\mathcal{F}(D)$ given by the composition

$$\begin{aligned} (\mathcal{F}(f) \circ \mathcal{F}(s))(X) &\xrightarrow{(\mathcal{F}(f) \circ \mathcal{F}(s))(u)} (\mathcal{F}(f) \circ \mathcal{F}(s) \circ \mathcal{F}(f'))(Y) \\ &\simeq \mathcal{F}(f \circ s \circ f')(Y) \\ &= \mathcal{F}(t)(Y), \end{aligned}$$

where the unlabeled isomorphism is supplied by the composition constraints for the functor \mathcal{F} .

04CG **Proposition 8.6.1.10.** *Let \mathcal{C} be a category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor. Then, after passing to nerves, the functor*

$$T : (\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \int_{\mathcal{C}} \mathcal{F}$$

of Construction 8.6.1.9 exhibits the forgetful functor $U^{\dagger} : \int^{\mathcal{C}^{\text{op}}} \mathcal{F} \rightarrow \mathcal{C}^{\text{op}}$ as a cartesian conjugate of the forgetful functor $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$.

Proof. Condition (0) of Definition 8.6.1.1 follows immediately from the construction. To verify condition (1), we observe that for each object $C \in \mathcal{C}$, the functor

$$T_C : (\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \{C\} \rightarrow \{C\} \times_{\mathcal{C}} (\int_{\mathcal{C}} \mathcal{F})$$

can be identified with the functor $\mathcal{F}(\text{id}_C) : \mathcal{F}(C) \rightarrow \mathcal{F}(C)$. The identity constraint of \mathcal{F} supplies an isomorphism of functors $\text{id}_{\mathcal{F}(C)} \xrightarrow{\sim} T_C$, so that T_C is an equivalence of categories. To verify condition (2), suppose we are given a morphism e in the category $(\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. We wish to show that, if the image of e in the category $\int^{\mathcal{C}^{\text{op}}} \mathcal{F}$ is U^{\dagger} -cartesian, then $T(e)$ is a U -cocartesian morphism in the category $\int_{\mathcal{C}} \mathcal{F}$. Writing $e = (f, f', u)$ and $T(e) = (f, v)$ as in Construction 8.6.1.9, we are reduced to showing that if u is an isomorphism, then v is also an isomorphism (Proposition 5.7.1.15), which is immediate from the construction. \square

04CH **Construction 8.6.1.11** (Conjugacy for Weighted Nerves). Let QCat denote the category of ∞ -categories (which we regard as a full subcategory of the category of simplicial sets). Let \mathcal{C} be a category equipped with a functor $\mathcal{F} : \mathcal{C} \rightarrow \text{QCat}$, and let $\mathcal{E} = N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ denote the weighted nerve of Definition 5.3.3.1. We will identify n -simplices of \mathcal{E} with pairs (σ_+, τ_+) , where $\sigma_+ = (C_0 \rightarrow C_1 \rightarrow \cdots \rightarrow C_n)$ is an n -simplex of the simplicial set $N_{\bullet}(\mathcal{C})$ and $\tau_+ = (\tau_0, \tau_1, \dots, \tau_n)$ is the datum of a commutative diagram

$$\begin{array}{ccccccc} \Delta^{0\subset} & \longrightarrow & \Delta^{1\subset} & \longrightarrow & \Delta^{2\subset} & \longrightarrow & \cdots \subset \longrightarrow \Delta^n \\ \downarrow \tau_0 & & \downarrow \tau_1 & & \downarrow \tau_2 & & \downarrow \tau_n \\ \mathcal{F}(C_0) & \longrightarrow & \mathcal{F}(C_1) & \longrightarrow & \mathcal{F}(C_2) & \longrightarrow & \cdots \longrightarrow \mathcal{F}(C_n). \end{array}$$

Let $U : \mathcal{E} \rightarrow N_{\bullet}(\mathcal{C})$ be the cocartesian fibration of Corollary 5.3.3.16, given on n -simplices by the formula $U(\sigma_+, \tau_+) = \sigma_+$.

Let $\mathcal{F}^{\text{op}} : \mathcal{C} \rightarrow \text{QCat}$ denote the functor given by the formula $\mathcal{F}^{\text{op}}(C) = \mathcal{F}(C)^{\text{op}}$, and let \mathcal{E}^{\dagger} denote the ∞ -category $N_{\bullet}^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}}$. Unwinding the definitions, we see that n -simplices of \mathcal{E}^{\dagger} can be identified with pairs (σ_-, τ_-) , where $\sigma_- = (C'_n \rightarrow C'_{n-1} \rightarrow \cdots \rightarrow C'_0)$ is

an n -simplex of the simplicial set $N_{\bullet}(\mathcal{C})^{\text{op}}$ and $\tau_- = (\tau'_n, \tau'_{n-1}, \dots, \tau'_0)$ is the datum of a commutative diagram

$$\begin{array}{ccccccc} \{n\} & \hookrightarrow & N_{\bullet}(\{n-1 < n\}) & \hookrightarrow & \cdots & \hookrightarrow & \Delta^n \\ \tau'_n \downarrow & & \downarrow \tau'_{n-1} & & & & \downarrow \tau'_0 \\ \mathcal{F}(C'_n) & \longrightarrow & \mathcal{F}(C'_{n-1}) & \longrightarrow & \cdots & \longrightarrow & \mathcal{F}(C'_0). \end{array}$$

Corollary 5.3.3.16 supplies a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow N_{\bullet}(\mathcal{C})^{\text{op}}$, given on n -simplices by the formula $U^\dagger(\sigma_-, \tau_-) = \sigma_-$.

Let us identify n -simplices of the fiber product $\mathcal{E}^\dagger \times_{N_{\bullet}(\mathcal{C})^{\text{op}}} \text{Tw}(N_{\bullet}(\mathcal{C}))$ with quadruples $(\sigma_-, \tau_-, \sigma_+, e)$, where $\sigma_- = (C'_n \rightarrow \cdots \rightarrow C'_0)$ is an n -simplex of $N_{\bullet}(\mathcal{C})^{\text{op}}$, $\tau_- = (\tau'_n, \dots, \tau'_0)$ is as above, $\sigma_+ = (C_0 \rightarrow \cdots \rightarrow C_n)$ is an n -simplex of $N_{\bullet}(\mathcal{C})$, and $e : C'_0 \rightarrow C_0$ is a morphism in the category \mathcal{C} . For $0 \leq i \leq n$, we let τ_i denote the i -simplex of $\mathcal{F}(C_i)$ given by the composition

$$\Delta^i \hookrightarrow \Delta^n \xrightarrow{\tau'_0} \mathcal{F}(C'_0) \xrightarrow{\mathcal{F}(e)} \mathcal{F}(C_0) \rightarrow \mathcal{F}(C_i).$$

Set $\tau_+ = (\tau_0, \dots, \tau_n)$, so that the pair (σ_+, τ_+) determines an n -simplex of the simplicial set \mathcal{E} . The construction $(\sigma_-, \tau_-, \sigma_+, e) \mapsto (\sigma_+, \tau_+)$ is compatible with face and degeneracy operators, and therefore determines a functor of ∞ -categories

$$T : \mathcal{E}^\dagger \times_{N_{\bullet}(\mathcal{C})^{\text{op}}} \text{Tw}(N_{\bullet}(\mathcal{C})) \rightarrow \mathcal{E}.$$

Proposition 8.6.1.12. *Let \mathcal{C} be a category equipped with a functor $\mathcal{F} : \mathcal{C} \rightarrow \text{QCat}$, let 04CJ $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ denote the cocartesian fibration of Corollary 5.3.3.16, and define $U^\dagger : N_{\bullet}^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}} \rightarrow N_{\bullet}(\mathcal{C})^{\text{op}}$ similarly. Then the functor*

$$T : N_{\bullet}^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}} \times_{N_{\bullet}(\mathcal{C})^{\text{op}}} \text{Tw}(N_{\bullet}(\mathcal{C})) \rightarrow N_{\bullet}^{\mathcal{F}}(\mathcal{C})$$

of Construction 8.6.1.11 exhibits U^\dagger as a cartesian conjugate of U .

Proof. Condition (0) of Definition 8.6.1.1 follows immediately from the construction. Condition (1) follows from the observation that, for each object $C \in \mathcal{C}$, the induced map

$$T_C : N_{\bullet}^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}} \times_{N_{\bullet}(\mathcal{C})^{\text{op}}} \{C\} \rightarrow \{C\} \times_{N_{\bullet}(\mathcal{C})} N_{\bullet}^{\mathcal{F}}(\mathcal{C})$$

is an isomorphism of simplicial sets (under the identifications supplied by Example 5.3.3.8, it corresponds to the identity functor from the ∞ -category $\mathcal{F}(C)$ to itself). Condition (2) follows from the characterization of U -cocartesian and $U^{\dagger, \text{op}}$ -cocartesian morphisms given in Corollary 5.3.3.16. \square

We close this section with a technical result, which will be convenient for verifying hypothesis (2) of Definition 8.6.1.1. If \mathcal{C} is a simplicial set and $e : C \rightarrow D$ is an edge of \mathcal{C} , we write $e_L : \text{id}_C \rightarrow e$ and $e_R : \text{id}_D \rightarrow e$ for the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6.

04CK Proposition 8.6.1.13. *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \xrightarrow{\lambda_+} & \mathcal{C}. \end{array}$$

Then T satisfies condition (2) of Definition 8.6.1.1 if and only if it satisfies both of the following conditions:

- (2') *For every object $Y \in \mathcal{E}^\dagger$ having image $\overline{Y} = U^\dagger(Y)$ and every edge $e : \overline{Y} \rightarrow \overline{X}$ of \mathcal{C} , the morphism T carries $(\text{id}_Y, e_L) : (Y, \text{id}_{\overline{Y}}) \rightarrow (Y, e)$ to a U -cocartesian edge of \mathcal{E} .*
- (2'') *Let $f : X \rightarrow Y$ be a U^\dagger -cartesian edge of \mathcal{E}^\dagger . Set $\overline{X} = U^\dagger(X)$ and $\overline{Y} = U^\dagger(Y)$, so that $U^\dagger(f)$ can be identified with an edge $e : \overline{Y} \rightarrow \overline{X}$ of the simplicial set \mathcal{C} . Then T carries $(f, e_R) : (X, \text{id}_{\overline{X}}) \rightarrow (Y, e)$ to an isomorphism in the ∞ -category $\mathcal{E}_{\overline{Y}}$.*

Proof. The implication $(2) \Rightarrow (2')$ is immediate from the definitions, and the implication $(2) \Rightarrow (2'')$ follows from Proposition 5.1.4.11. For the converse, suppose that conditions (2') and (2'') are satisfied. Let $f : X \rightarrow Y$ be a U^\dagger -cartesian edge of \mathcal{E}^\dagger , and let us identify $U^\dagger(f)$ with an edge $e : \overline{Y} \rightarrow \overline{X}$ of the simplicial set \mathcal{C} . Suppose we are given a lift of e to an edge $\tilde{e} : u \rightarrow v$ of $\text{Tw}(\mathcal{C})$, which we identify with a 3-simplex $\sigma : \Delta^3 \rightarrow \mathcal{C}$ depicted in the diagram

$$\begin{array}{ccc} \overline{X} & \xleftarrow{e} & \overline{Y} \\ \downarrow u & & \downarrow v \\ \overline{X}' & \longrightarrow & \overline{Y}'. \end{array}$$

We wish to show that $T(f, \tilde{e})$ is a U -cocartesian edge of \mathcal{E} .

Let σ' denote the degenerate 5-simplex of \mathcal{C} given by $\gamma^*(\sigma)$, where $\gamma : [5] \rightarrow [3]$ is given by $\gamma(0) = 0$, $\gamma(1) = \gamma(2) = \gamma(3) = 1$, $\gamma(4) = 2$, and $\gamma(5) = 3$. Let us abuse notation by

identifying σ' with the 2-simplex of $\text{Tw}(\mathcal{C})$ depicted in the diagram

$$\begin{array}{ccccc}
 \overline{X} & \xleftarrow{\text{id}} & \overline{X} & \xleftarrow{e} & \overline{Y} \\
 \downarrow \text{id} & & \downarrow u & & \downarrow v \\
 \overline{X} & \xrightarrow{u} & \overline{X}' & \longrightarrow & \overline{Y}'.
 \end{array} \tag{8.60} \quad \text{04CL}$$

Evaluating T on the pair $(s_0(f), \sigma')$, we obtain a 2-simplex of \mathcal{E} depicted in the diagram

$$\begin{array}{ccc}
 & T(X, u) & \\
 T(\text{id}_X, u_L) \nearrow & & \searrow T(f, \tilde{e}) \\
 T(X, \text{id}_X) & \longrightarrow & T(Y, v),
 \end{array}$$

where the left diagonal map is U -cocartesian by virtue of assumption (2'). Consequently, to show that the $T(f, \tilde{e})$ is U -cocartesian, it will suffice to show that the horizontal edge is U -cocartesian (Proposition 5.1.4.12). Note that, in the special case where $\sigma = s_0(\sigma_0)$ for some 2-simplex σ_0 of \mathcal{C} , the horizontal edge coincides with $T(\text{id}_X, v_L)$, which is also U -cocartesian by virtue of (2').

To handle the general case, we can replace σ by the 3-simplex of \mathcal{C} given by the outer rectangle of the diagram (8.60) (that is, by the 3-simplex $\sigma'|_{N_\bullet(\{0 < 2 < 3 < 5\})}$), and thereby reduce to the special case where $\sigma = s_1(\sigma_1)$, for some 2-simplex σ_1 of \mathcal{C} (so that $\overline{X} = \overline{X}'$ and u is a degenerate edge of \mathcal{C}). In this case, we let σ'' denote the 5-simplex of \mathcal{C} given by $\beta^*(\sigma_1)$, where $\beta : [5] \rightarrow [2]$ is given by $\beta(0) = \beta(1) = 0$, $\beta(2) = \beta(3) = \beta(4) = 1$, and $\beta(5) = 2$. Let us view σ'' as a 2-simplex of $\text{Tw}(\mathcal{C})$ depicted in the diagram

$$\begin{array}{ccccc}
 \overline{X} & \xleftarrow{e} & \overline{Y} & \xleftarrow{\text{id}} & \overline{Y} \\
 \downarrow u & & & & \\
 \overline{X}' & \xrightarrow{\text{id}} & \overline{X}' & \longrightarrow & \overline{Y}'.
 \end{array}$$

Evaluating T on the pair $(s_1(f), \sigma'')$, we obtain a 2-simplex of \mathcal{E} depicted in the diagram

$$\begin{array}{ccc}
 & T(Y, e) & \\
 T(f, e_R) \nearrow & & \searrow T(f, \tilde{e}) \\
 T(X, u) & \xrightarrow{T(f, \tilde{e})} & T(Y, v).
 \end{array}$$

Here the left diagonal edge is U -cocartesian by virtue of assumption (2'') and the right diagonal edge is U -cocartesian by virtue of the special case treated above. Applying Proposition 5.1.4.12, we conclude that $T(f, \tilde{e})$ is also U -cocartesian. \square

8.6.2 Existence of Conjugate Fibrations

04CM Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Our goal in this section is to show that U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ (Corollary 8.6.2.4), which is uniquely determined up to equivalence (Corollary 8.6.2.9). For this purpose, we will need to construct a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{\quad} & \mathcal{E} \\ & \searrow & \swarrow U \\ & \mathcal{C}. & \end{array}$$

We begin by considering the universal example of such a diagram.

04CN **Notation 8.6.2.1.** Let \mathcal{D} be a simplicial set equipped with a morphism $\lambda = (\lambda_-, \lambda_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$. For every simplicial set \mathcal{E} , we let $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ denote the relative exponential of Construction 4.5.9.1. For $n \geq 0$, we will identify n -simplices of $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ with pairs (σ, f) , where σ is an n -simplex of $\mathcal{D}_-^{\text{op}}$ and $f : \Delta^n \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} \rightarrow \mathcal{E}$ is a morphism of simplicial sets. Suppose that we are also given a morphism of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{D}_+$. In this case, we let $\text{Fun}_{/\mathcal{D}_+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ denote the simplicial subset of $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ whose n -simplices are pairs (σ, f) which satisfy the additional condition that the diagram

$$\begin{array}{ccc} \Delta^n \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} & \xrightarrow{f} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \mathcal{D} & \xrightarrow{\lambda_+} & \mathcal{D}_+ \end{array}$$

is commutative.

04CP **Construction 8.6.2.2.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ be the simplicial set given in Notation 8.6.2.1. Unwinding the definitions, we see that vertices of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ can be identified with pairs (C, f_C) ,

where C is an object of \mathcal{C} and f_C is a morphism which fits into a commutative diagram

$$\begin{array}{ccc} \{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{f_C} & \mathcal{E} \\ & \searrow & \downarrow U \\ & & \mathcal{C}. \end{array}$$

We let $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$ denote the full simplicial subset of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$, spanned by those pairs (C, f_C) where the morphism f_C carries each edge of $\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ to a U -cocartesian edge of \mathcal{E} . By construction, the simplicial set $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$ is equipped with a projection map $V : \mathcal{E}^{\dagger} \rightarrow \mathcal{C}^{\text{op}}$ and an evaluation map $\text{ev} : \mathcal{E}^{\dagger} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$, given on vertices by the construction $(C, f_C, u : C \rightarrow C') \mapsto f_C(u)$.

We can now formulate the main result of this section:

Proposition 8.6.2.3. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Then the 04CQ projection map $V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ of Construction 8.6.2.2 is a cartesian fibration of ∞ -categories, and the evaluation functor*

$$\text{ev} : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E} \quad (C, f_C, u : C \rightarrow C') \mapsto f_C(u)$$

exhibits V as a cartesian conjugate of U .

Corollary 8.6.2.4. *Every cocartesian fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$ admits a 04CR cartesian conjugate.*

Proof. Using Corollary 5.7.7.3, we can choose a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \mathcal{E}' \\ \downarrow U & & \downarrow U' \\ \mathcal{C} & \longrightarrow & \mathcal{C}', \end{array}$$

where U' is a cocartesian fibration of ∞ -categories. By virtue of Remark 8.6.1.4, it will suffice to show that U' admits a cartesian conjugate, which follows from Proposition 8.6.2.3. \square

Warning 8.6.2.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. If \mathcal{C} is not 04CS an ∞ -category, then the morphism $V : \text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ given by Construction 8.6.2.2 need not be a cartesian conjugate of U . In §8.6.6, we will give an alternative construction of a cartesian conjugate which works in complete generality (Corollary 8.6.6.7).

The proof of Proposition 8.6.2.3 will require some preliminaries.

04CT **Lemma 8.6.2.6.** *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be a coupling of ∞ -categories and let $U : \mathcal{E} \rightarrow \mathcal{D}_+$ be an isofibration. Then:*

- (1) *The projection map $\bar{V} : \text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{D}_-^{\text{op}}$ is a cartesian fibration of ∞ -categories.*
- (2) *Let \tilde{e} be a morphism in the ∞ -category $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$, corresponding to a morphism e of $\mathcal{D}_-^{\text{op}}$ and a functor $f_e : \Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} \rightarrow \mathcal{E}$. Then \tilde{e} is \bar{V} -cartesian if and only if, for every morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ whose image in \mathcal{D}_+ is an isomorphism, the image $f_e(u)$ is an isomorphism in \mathcal{E} .*

Proof. Unwinding the definitions, we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \text{Fun}_{/\mathcal{D}_+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E}) & \longrightarrow & \text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E}) \\ \downarrow \bar{V} & & \downarrow \bar{V}' \\ \mathcal{D}_-^{\text{op}} & \longrightarrow & \text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{D}_+), \end{array}$$

where the lower horizontal map classifies the morphism $\lambda_+ : \mathcal{D} \rightarrow \mathcal{D}_+$ and \bar{V}' is given by composition with U . The functor $\lambda_- : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}}$ is a cocartesian fibration (Proposition 8.2.1.7) and therefore exponentiable (Proposition 5.3.6.1). It follows from Proposition 4.5.9.17 guarantees that \bar{V}' is an isofibration, so that \bar{V} is also an isofibration.

Let us say that a morphism \tilde{e} in the ∞ -category $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ is *special* if it satisfies the condition described in (2). Let us identify \tilde{e} with a pair (e, f_e) , where $e : D' \rightarrow D$ is a morphism in the ∞ -category $\mathcal{D}_-^{\text{op}}$ and $f_e : \Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} \rightarrow \mathcal{E}$ is a functor of ∞ -categories. Let $\pi : \Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} \rightarrow \Delta^1$ be given by the projection map onto the first factor. Then π is a cocartesian fibration, and a morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ is π -cocartesian if and only if its image in \mathcal{D}_+ is an isomorphism (see Proposition 8.2.1.7). If this condition is satisfied, the assumption that \tilde{e} is special guarantees that $f_e(u)$ is an isomorphism in the ∞ -category \mathcal{E} , and is therefore U -cartesian (Proposition 5.1.1.8). Applying Lemma 5.3.6.11, we deduce that \tilde{e} is \bar{V}' -cartesian when regarded as a morphism of $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$, and therefore also \bar{V} -cartesian when regarded as a morphism of $\text{Fun}_{/\mathcal{D}_+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$.

To show that \bar{V} is a cartesian fibration, it will suffice to show that if (D, f_D) is an object of $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$, then every morphism $e : C \rightarrow D$ in the ∞ -category $\mathcal{D}_-^{\text{op}}$ can be lifted to a special morphism $\tilde{e} : (C, f_C) \rightarrow (D, f_D)$ in $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$. We first claim that the

lifting problem

$$\begin{array}{ccc}
 \{D\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C} & \xrightarrow{f_D} & \mathcal{E} \\
 \downarrow & \nearrow f_e & \downarrow U \\
 \Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} & \longrightarrow & \mathcal{D}_+
 \end{array}$$

admits a solution f_e which is U -right Kan extended from $\{D\} \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$. Using the criterion of Corollary 7.3.5.9, we are reduced to showing that if $u : X' \rightarrow X$ is a π -cocartesian morphism of $\Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ lying over the nondegenerate edge of Δ^1 , then its image in \mathcal{D}_+ can be lifted to a U -cartesian morphism $E \rightarrow f_D(X)$ in \mathcal{E} . Since the image of u in \mathcal{D}_+ is an isomorphism (Proposition 8.2.1.7), this follows from our assumption that U is an isofibration. Note that the functor f_e carries every π -cocartesian morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ to an isomorphism in \mathcal{D} (if the image of u in Δ^1 is degenerate, then u is an isomorphism and this condition is automatically satisfied), so that $\tilde{e} = (e, f_e)$ is a special morphism of $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ having target (D, f_D) . This completes the proof of (1).

To complete the proof of (2), it will suffice to show that every \bar{V} -cartesian morphism $\tilde{e} = (C, f_C) \rightarrow (D, f_D)$ of $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ is special. Let $e : C \rightarrow D$ denote the image of \tilde{e} in the ∞ -category $\mathcal{D}_-^{\text{op}}$. Using the preceding argument, we can lift e to a special morphism $\tilde{e}' : (C, f'_C) \rightarrow (D, f_D)$ of $\text{Fun}_{/\mathcal{D}^+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$. Write $\tilde{e} = (e, f_e)$ and $\tilde{e}' = (e, f'_e)$. Since \tilde{e}' is also \bar{V} -cartesian, Remark 5.1.3.8 guarantees that the functors f_e and f'_e are isomorphic. In particular, if u is a morphism of $\Delta^1 \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ such that $f'_e(u)$ is an isomorphism in \mathcal{E} , then $f_e(u)$ is also an isomorphism in \mathcal{E} . It follows that the morphism \tilde{e} is also special, as desired. \square

Lemma 8.6.2.7. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $\bar{V} : \text{04CU}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ be the cartesian fibration of Lemma 8.6.2.6. Then:*

- (1) *Let $\tilde{e} : (C, f_C) \rightarrow (D, f_D)$ be a \bar{V} -cartesian morphism of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$. If (D, f_D) belongs to the simplicial subset $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ of Construction 8.6.2.2, then (C, f_C) also belongs to $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$.*
- (2) *The morphism \bar{V} restricts to a cartesian fibration of ∞ -categories*

$$V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}.$$

- (3) *A morphism in the ∞ -category $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ is V -cartesian if and only if it is \bar{V} -cartesian when regarded as a morphism of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$.*

Proof. We will prove assertion (1); assertions (2) and (3) then follow as formal consequences (see Proposition 5.1.4.16). Let us identify \tilde{e} with a pair (e, f_e) , where $e : C \rightarrow D$ is a morphism in the ∞ -category \mathcal{C}^{op} and $f_e : \Delta^1 \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ is a functor. Let $u : \tilde{C} \rightarrow \tilde{C}'$ be a morphism in the fiber $\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$; we wish to show that $f_C(u)$ is a U -cocartesian morphism of \mathcal{E} . Since the projection map $\Delta^1 \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \Delta^1$ is a cocartesian fibration, we can choose a diagram

$$\begin{array}{ccc} \tilde{C} & \longrightarrow & \tilde{D} \\ \downarrow u & & \downarrow v \\ \tilde{C}' & \longrightarrow & \tilde{D}' \end{array}$$

in the ∞ -category $\Delta^1 \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$, where v is a morphism of $\{D\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ and the horizontal maps are π -cocartesian. Applying the functor f_e , we obtain a diagram

$$\begin{array}{ccc} f_C(\tilde{C}) & \longrightarrow & f_D(\tilde{D}) \\ \downarrow f_C(u) & & \downarrow f_D(v) \\ f_C(\tilde{C}') & \longrightarrow & f_D(\tilde{D}') \end{array}$$

in the ∞ -category \mathcal{E} , where the horizontal maps are isomorphisms (by virtue of our assumption that \tilde{e} is \overline{V} -cartesian; see Lemma 8.6.2.6). It will therefore suffice to show that $f_D(v)$ is U -cocartesian (Corollary 5.1.2.5), which follows from our assumption that (D, f_D) is an object of $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$. \square

We will deduce Proposition 8.6.2.3 from the following more precise result:

04CV **Proposition 8.6.2.8.** *Let \mathcal{C} be an ∞ -category, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ & \searrow & \swarrow U \\ & \mathcal{C}, & \end{array}$$

which we identify with a functor $F : \mathcal{E}^\dagger \rightarrow \text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$. The following conditions are equivalent:

- (a) The functor T exhibits U^\dagger as a cartesian conjugate of U (in the sense of Definition 8.6.1.1).
- (b) The functor F restricts to an equivalence of \mathcal{E}^\dagger with the full subcategory

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \subseteq \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$$

introduced in Construction 8.6.2.2.

Proof. Let $\lambda = (\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ denote the twisted arrow fibration of Example 8.2.0.2. Recall that (a) is equivalent to the following pair of conditions:

- (a₁) For every object $C \in \mathcal{C}$, the restriction of T to the fiber over the vertex $\{\mathrm{id}_C\} \subseteq \mathrm{Tw}(\mathcal{C})$ determines an equivalence of ∞ -categories $T_C : \mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \rightarrow \{C\} \times_{\mathcal{C}} \mathcal{E}$.
- (a₂) Let (e', e) be an edge of the fiber product $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If e' is a U^\dagger -cartesian morphism of \mathcal{E}^\dagger , then $T(e', e)$ is a U -cocartesian morphism of \mathcal{E} .

Unwinding the definitions, we see that F factors through $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ if and only if T satisfies the following weaker version of (a₂):

- (b₀) Let (e', e) be an edge of the fiber product $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If e' is a degenerate edge of \mathcal{E}^\dagger , then $T(e', e)$ is a U -cocartesian morphism of \mathcal{E} .

If this condition is satisfied, then we have a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger & \xrightarrow{F} & \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \\ & \searrow^{U^\dagger} & \swarrow V \\ & \mathcal{C}^{\mathrm{op}}, & \end{array}$$

where the vertical maps are cartesian fibrations (Lemma 8.6.2.7). Using Theorem 5.1.6.1, we see that F is an equivalence if and only if it satisfies the following further conditions:

- (b₁) For each object $C \in \mathcal{C}$, the functor F restricts to an equivalence of ∞ -categories

$$F_C : \mathcal{E}_C^\dagger = \mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}.$$

- (b₂) The functor F carries U^\dagger -cartesian morphisms of \mathcal{E}^\dagger to V -cartesian morphisms of $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$.

Let C be an object of \mathcal{C} . Unwinding the definitions, we can identify the fiber

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$$

with the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E})$. Since id_C is initial when viewed as an object of the ∞ -category $\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (Proposition 8.1.2.1), Proposition 5.3.1.21 guarantees that the evaluation map

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\{C\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E}) \rightarrow \{C\} \times_{\mathcal{C}} \mathcal{E}$$

is a trivial Kan fibration. Moreover, the composition of this evaluation map with the functor F_C coincides with the functor T_C appearing in condition (a_1) . It follows that conditions (a_1) and (b_1) are equivalent.

Using the characterization of V -cartesian morphisms supplied by Lemmas 8.6.2.6 and 8.6.2.7, we can reformulate (b_2) more concretely as follows:

- (b'_2) Let (e', e) be an edge of the fiber product $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If e' is a U^\dagger -cartesian morphism of \mathcal{E}^\dagger and $\lambda_+(e)$ is an isomorphism in \mathcal{C} , then $T(e', e)$ is an isomorphism in the ∞ -category \mathcal{E} .

To complete the proof, it will suffice to show that the functor T satisfies (a_2) if and only if it satisfies both (b_0) and (b'_2) . The implication $(a_2) \Rightarrow (b_0)$ is immediate, and the implication $(a_2) \Rightarrow (b'_2)$ follows from Corollary 5.1.1.8. The reverse implication follows from Proposition 8.6.1.13. \square

Proof of Proposition 8.6.2.3. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. It follows from Lemma 8.6.2.7 that the projection map $V : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration. We wish to show that the evaluation map

$$\mathrm{ev} : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

exhibits V as a cartesian conjugate of U . This follows from Proposition 8.6.2.8, since the identity automorphism of $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})$ is an equivalence of ∞ -categories. \square

04CW **Corollary 8.6.2.9** (Uniqueness). *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Then U admits a cartesian conjugate, which is uniquely determined up to equivalence.*

Proof. By virtue of Proposition 8.6.2.8, a cartesian fibration is conjugate to U if and only if it is equivalent to the cartesian fibration $V : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\mathrm{op}}$ of Construction 8.6.2.2. \square

04CX **Remark 8.6.2.10.** The conclusion of Corollary 8.6.2.9 does not require the assumption that \mathcal{C} is an ∞ -category; see Corollary 8.6.6.8.

Let \mathcal{C} be an ∞ -category, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. It follows from Proposition 8.6.2.8 that if there exists a functor

$$T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

which exhibits U^\dagger as a cartesian conjugate of U , then U^\dagger can be recovered from U up to equivalence. We close this section by showing that, in the same situation, we can also recover U from the cartesian fibration U^\dagger .

Proposition 8.6.2.11. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration of ∞ -categories, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array}$$

which exhibits U^\dagger as a cartesian conjugate of U . Then T also exhibits \mathcal{E} as a localization of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with respect to W , where W is the collection of all morphisms $w = (w', w'')$ where w' is a U' -cartesian morphism of \mathcal{E}^\dagger and w'' is a morphism of $\text{Tw}(\mathcal{C})$ whose image in \mathcal{C} is degenerate.

Remark 8.6.2.12. The converse of Proposition 8.6.2.11 is also true; see Corollary 8.6.6.3. 04CZ

Proof of Proposition 8.6.2.11. Let $\lambda = (\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ denote the twisted arrow coupling of Example 8.2.0.2, and let $V : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ denote the composition of λ_+ with projection onto the second factor. Note that V factors as a composition

$$\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \xrightarrow{\text{id} \times \lambda} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} (\mathcal{C}^{\text{op}} \times \mathcal{C}) \simeq \mathcal{E}^\dagger \times \mathcal{C} \rightarrow \mathcal{C},$$

where the first map is a left fibration (since it is a pullback of λ , which is a left fibration by virtue of Proposition 8.1.1.15), and the last map is a cocartesian fibration (since it is a pullback of the projection map $\mathcal{E}^\dagger \rightarrow \Delta^0$). It follows that V is a cocartesian fibration, and that a morphism of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ is V -cocartesian if and only if its image in \mathcal{E}^\dagger is an isomorphism. In particular, our hypotheses on T guarantees that it carries V -cocartesian morphisms of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ to U -cocartesian morphisms of \mathcal{E} .

Fix an object $C \in \mathcal{C}$. Let $\mathcal{E}^\dagger(C)$ denote the fiber $V^{-1}\{C\} = \mathcal{E}' \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{C\}$, so that projection onto the middle factor gives a map $U_C^\dagger : \mathcal{E}^\dagger(C) \rightarrow \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{C\}$. Note that U_C^\dagger is a pullback of U^\dagger . It follows that U_C^\dagger is a cartesian fibration, and that a morphism of $\mathcal{E}^\dagger(C)$ is U_C^\dagger -cartesian if and only if its image in \mathcal{E}^\dagger is U^\dagger -cartesian (Remark 5.1.4.6). Let W_C denote

the collection of morphisms of $\mathcal{E}^\dagger(C)$ which satisfy this condition, so that $W = \bigcup_{C \in \mathcal{C}} W_C$. Note that T restricts to a functor $T^C : \mathcal{E}^\dagger(C) \rightarrow \mathcal{E}_C$. By virtue of Proposition 6.3.5.2, it will suffice to verify the following (for each object $C \in \mathcal{C}$):

- ($*_C$) The functor T^C exhibits the ∞ -category \mathcal{E}_C as a localization of $\mathcal{E}^\dagger(C)$ with respect to W_C .

Let \mathcal{K} denote the full subcategory of $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \{C\}$ whose objects are isomorphisms $D \rightarrow C$. By virtue of Proposition 8.1.2.1, \mathcal{K} can also be described as the full subcategory of $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \{C\}$ spanned by its initial objects. It follows that \mathcal{K} is a coreflective subcategory of $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \{C\}$ (Example 6.2.2.5). Let $\mathcal{E}_0^\dagger(C) \subseteq \mathcal{E}^\dagger(C)$ denote the inverse image of \mathcal{K} under U_C^\dagger , so that $\mathcal{E}_0^\dagger(C)$ is a coreflective subcategory of $\mathcal{E}^\dagger(C)$ (Proposition 6.2.2.17). Using Lemma 6.2.2.11, we can choose a functor $L : \mathcal{E}^\dagger(C) \rightarrow \mathcal{E}_0^\dagger(C)$ and a natural transformation $\epsilon : L \rightarrow \text{id}_{\mathcal{E}^\dagger(C)}$ which exhibits L as a $\mathcal{E}_0^\dagger(C)$ -coreflection functor. Our assumption on T guarantees that the functor T^C carries each element of W_C to an isomorphism in $\mathcal{E}_0^\dagger(C)$, so that ϵ induces an isomorphism of functors $(T^C|_{\mathcal{E}_0^\dagger(C)} \circ L) \rightarrow T^C$. Since the Kan complex \mathcal{K} is contractible (Corollary 4.6.6.14), the inclusion map $\{\text{id}_C\} \hookrightarrow \mathcal{K}$ is a homotopy equivalence of Kan complexes, and therefore induces an equivalence of ∞ -categories $\mathcal{E}^\dagger(C) \times_{\mathcal{C}^{\text{op}}} \{C\} \simeq \mathcal{E}_0^\dagger(C)$ (Corollary 4.5.2.24). Since the composition

$$\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \{C\} \hookrightarrow \mathcal{E}_0^\dagger(C) \xrightarrow{T^C} \mathcal{E}_C$$

is an equivalence of ∞ -categories, we conclude that the functor $T^C|_{\mathcal{E}_0^\dagger(C)}$ is also an equivalence of ∞ -categories. To complete the proof of (2_C) , it will suffice to show that the functor L exhibits $\mathcal{E}_0^\dagger(C)$ as a localization of $\mathcal{E}^\dagger(C)$ with respect to W_C (see Remark 6.3.1.19). Let W_C^+ denote the collection of morphisms v of $\mathcal{E}^\dagger(C)$ such that $L(v)$ is an isomorphism in $\mathcal{E}_0^\dagger(C)$. By virtue of the preceding arguments, this is equivalent to the requirement that $T(v)$ is an isomorphism in the ∞ -category \mathcal{E}_C ; in particular, assumption (1) guarantees that W_C is contained in W_C^+ . Conversely, if $u : Y \rightarrow Z$ is a morphism of $\mathcal{E}^\dagger(C)$ which belongs to W_C^+ , then we can choose a commutative diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & \swarrow v & \\ X & \xrightarrow{w} & Z \end{array}$$

where u and w exhibit X as $\mathcal{E}_0^\dagger(C)$ -coreflections of the objects Y and Z , respectively, and therefore belong to W_C . We are therefore reduced to showing that the functor L exhibits $\mathcal{E}_0^\dagger(C)$ as a localization of $\mathcal{E}^\dagger(C)$ with respect to W_C^+ , which is a special case of Proposition 6.3.3.5. \square

8.6.3 Dual Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. By virtue of Corollary 04D0 8.6.2.9, U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$, which is uniquely determined up to equivalence. Setting $\mathcal{E}^\vee = \mathcal{E}^{\dagger, \text{op}}$ and $U^\vee = U^{\dagger, \text{op}}$, we obtain another cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$. Our goal in this section is to give a direct characterization of the relationship between U and U^\vee , which does not rely on the theory of conjugate fibrations developed in §8.6.1 and §8.6.2. To fix ideas, let us begin by considering the case $\mathcal{C} = \Delta^0$. In this case, the conjugate fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is characterized by the requirement that the ∞ -category \mathcal{E}^\dagger is equivalent to \mathcal{E} . Consequently, the cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is characterized by the requirement that \mathcal{E}^\vee is equivalent to the opposite of \mathcal{E} . By virtue of Corollary 8.2.6.6, this is equivalent to the existence of a *balanced coupling* $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times \mathcal{E}$: that is, a left fibration which satisfies the following addition conditions:

- For every object $X \in \mathcal{E}$, there exists an object $\tilde{X} \in \tilde{\mathcal{E}}$ satisfying $\lambda_+(\tilde{X}) = X$ which is *universal*: that is, it is an initial object of the ∞ -category $\tilde{\mathcal{E}} \times_{\mathcal{E}} \{X\}$.
- For every object $X^\vee \in \mathcal{E}^\vee$, there exists an object $\tilde{X} \in \tilde{\mathcal{E}}$ satisfying $\lambda_-(\tilde{X}) = X^\vee$ which is *couniversal*: that is, it is an initial object of the ∞ -category $\{X^\vee\} \times_{\mathcal{E}^\vee} \tilde{\mathcal{E}}$.
- An object of $\tilde{\mathcal{E}}$ is universal if and only if it is couniversal.

We now extend the notion of balanced coupling to the relative setting.

Definition 8.6.3.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, and let $\lambda = (\lambda_-, \lambda_+) : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration of simplicial sets. We will say that λ *exhibits U^\vee as a cocartesian dual of U* if the following conditions are satisfied:

- (a) For every vertex $C \in \mathcal{C}$, the left fibration

$$\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$$

is a balanced coupling of ∞ -categories.

- (b) Let $\tilde{U} : \tilde{\mathcal{E}} \rightarrow \mathcal{C}$ denote the projection map $U^\vee \circ \lambda_- = U \circ \lambda_+$, $f : \tilde{X} \rightarrow \tilde{X}'$ be a \tilde{U} -cocartesian edge of $\tilde{\mathcal{E}}$, and let $e : C \rightarrow C'$ be its image $\tilde{U}(f)$ in the simplicial set \mathcal{C} . If the object $\tilde{X} \in \tilde{\mathcal{E}}_C$ is universal for the coupling λ_C , then the object $\tilde{X}' \in \tilde{\mathcal{E}}_{C'}$ is universal for the coupling $\lambda_{C'}$.

We say that U^\vee is a *cocartesian dual of U* if there exists a left fibration $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ which exhibits U^\vee as a cocartesian dual of U .

Example 8.6.3.2. Let \mathcal{E} and \mathcal{E}^\vee be ∞ -categories, and let $U : \mathcal{E} \rightarrow \Delta^0$ and $U^\vee : \mathcal{E}^\vee \rightarrow \Delta^0$ denote the projection maps. Then a left fibration $\tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\Delta^0} \mathcal{E} = \mathcal{E}^\vee \times \mathcal{E}$ exhibits U^\vee

as a cocartesian dual of U if and only if it is a balanced coupling. In particular, U^\vee is a cocartesian dual of U if and only if \mathcal{E}^\vee is equivalent to the opposite ∞ -category \mathcal{E}^{op} (Corollary 8.2.6.6).

04D3 **Remark 8.6.3.3** (Symmetry). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. Then a left fibration $\lambda = \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ exhibits U^\vee as a cocartesian dual of U if and only if it exhibits U as a cocartesian dual of U^\vee , after identifying $\mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ with $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}^\vee$. In particular, U^\vee is a cocartesian dual of U if and only if U is a cocartesian dual of U^\vee .

04D4 **Remark 8.6.3.4** (Base Change). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets and $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration. The following conditions are equivalent:

- (a) The left fibration λ exhibits U^\vee as a cocartesian dual of U (in the sense of Definition 8.6.3.1).
- (b) For every morphism of simplicial sets $\mathcal{C}_0 \rightarrow \mathcal{C}$, form a diagram of pullback squares

$$\begin{array}{ccccc} \mathcal{E}_0^\vee & \xrightarrow{U_0^\vee} & \mathcal{C}' & \xleftarrow{U_0} & \mathcal{E}_0 \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{E} & \xrightarrow{U^\vee} & \mathcal{C} & \xleftarrow{U} & \mathcal{E} .. \end{array}$$

Then the induced map

$$\lambda_0 : (\mathcal{C}_0 \times_{\mathcal{C}} \tilde{\mathcal{E}}) \rightarrow \mathcal{E}_0^\vee \times_{\mathcal{C}_0} \mathcal{E}_0$$

exhibits U_0^\vee as a cocartesian dual of U_0 .

Moreover, it suffices to verify condition (b) in the special case where $\mathcal{C}_0 = \Delta^1$ is the standard 1-simplex.

04D5 **Remark 8.6.3.5.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be a cocartesian dual of U . Then, for every morphism of simplicial sets $\mathcal{C}_0 \rightarrow \mathcal{C}$, the projection map $U_0^\vee : \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E}^\vee \rightarrow \mathcal{C}_0$ is a cocartesian dual of the projection map $U_0 : \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{C}_0$. In particular, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C^\vee = \{C\} \times_{\mathcal{C}} \mathcal{E}^\vee$ is equivalent to the opposite of the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ (Example 8.6.3.2).

04D6 **Remark 8.6.3.6.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$. In §8.6.6, we will show that U^\vee is a cocartesian dual of U (in the sense of Definition 8.6.3.1) if and only if the opposite fibration $U^{\vee,\text{op}} : \mathcal{E}^{\vee,\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian conjugate of U (in the sense of Definition 8.6.1.1). See Proposition 8.6.6.1.

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, and let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration. Condition (a) of Definition 8.6.3.1 guarantees that, for each vertex $C \in \mathcal{C}$, the coupling $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times_{\mathcal{C}} \mathcal{E}_C$ is representable by an equivalence of ∞ -categories $G_C : \mathcal{E}_C \rightarrow (\mathcal{E}_C^\vee)^{\text{op}}$ (Theorem 8.2.6.5). Heuristically, one can think of condition (b) as requiring that the equivalence G_C depends functorially on C . We can articulate this heuristic more precisely as follows:

Proposition 8.6.3.7. *Let $U : \mathcal{E} \rightarrow \Delta^1$ and $U^\vee : \mathcal{E}^\vee \rightarrow \Delta^1$ be cocartesian fibrations of 04D7 ∞ -categories, and let $F : \mathcal{E}_0 \rightarrow \mathcal{E}_1$ and $F^\vee : \mathcal{E}_0^\vee \rightarrow \mathcal{E}_1^\vee$ be functors given by covariant transport along the nondegenerate edge of Δ^1 . Let $\lambda = (\lambda_-, \lambda_+) : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\Delta^1} \mathcal{E}$ be a left fibration, and suppose that the associated couplings*

$$\lambda_0 : \tilde{\mathcal{E}}_0 \rightarrow \mathcal{E}_0^\vee \times \mathcal{E}_0 \quad \lambda_1 : \tilde{\mathcal{E}}_1 \rightarrow \mathcal{E}_1^\vee \times \mathcal{E}_1$$

are representable by functors $G_0 : \mathcal{E}_0 \rightarrow (\mathcal{E}_0^\vee)^{\text{op}}$ and $G_1 : \mathcal{E}_1 \rightarrow (\mathcal{E}_1^\vee)^{\text{op}}$, respectively. If λ satisfies condition (b) of Definition 8.6.3.1, then the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E}_0 & \xrightarrow{F} & \mathcal{E}_1 \\ \downarrow G_0 & & \downarrow G_1 \\ (\mathcal{E}_0^\vee)^{\text{op}} & \xrightarrow{(F^\vee)^{\text{op}}} & (\mathcal{E}_1^\vee)^{\text{op}} \end{array} \quad \begin{matrix} 04D8 \\ (8.61) \end{matrix}$$

commutes up to isomorphism.

Proof. Let \tilde{U} denote the composite map

$$\tilde{\mathcal{E}} \xrightarrow{\lambda} \mathcal{E}^\vee \times_{\Delta^1} \mathcal{E} \rightarrow \Delta^1.$$

Using Proposition 5.1.4.13, we see that λ is a cocartesian fibration, and that an edge e of $\tilde{\mathcal{E}}$ is \tilde{U} -cocartesian if and only if $\lambda_+(e)$ is a U -cocartesian edge of \mathcal{E} and $\lambda_-(e)$ is a U^\vee -cocartesian edge of \mathcal{E}^\vee . Let $\tilde{F} : \tilde{\mathcal{E}}_0 \rightarrow \tilde{\mathcal{E}}_1$ be given by covariant transport along the nondegenerate edge of Δ^1 . Using Remark 5.2.8.5, we see that the diagram of ∞ -categories

$$\begin{array}{ccc} \tilde{\mathcal{E}}_0 & \xrightarrow{\tilde{F}} & \tilde{\mathcal{E}}_1 \\ \downarrow \lambda_0 & & \downarrow \lambda_1 \\ \mathcal{E}_0^\vee \times \mathcal{E}_0 & \xrightarrow{F^\vee \times F} & \mathcal{E}_1^\vee \times \mathcal{E}_1 \end{array} \quad \begin{matrix} 04D9 \\ (8.62) \end{matrix}$$

commutes up to isomorphism. Since λ_1 is an isofibration, we can replace \tilde{F} by an isomorphic functor to arrange that the diagram (8.62) is strictly commutative (see Corollary 4.4.5.6).

Condition (b) of Definition 8.6.3.1 guarantees that the functor \tilde{F} carries universal objects of $\tilde{\mathcal{E}}_0$ (for the coupling λ_0) to universal objects of $\tilde{\mathcal{E}}_1$ (for the coupling λ_1). The commutativity of the diagram (8.61) now follows from Corollary 8.2.4.4. \square

- 04DA **Corollary 8.6.3.8.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat},$$

and let $\mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}^{\mathrm{op}}$ denote the functor $C \mapsto \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}(C)^{\mathrm{op}} = (\mathcal{E}_C^\vee)^{\mathrm{op}}$. Let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration such that, for each vertex $C \in \mathcal{C}$, the coupling $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$ is representable by a functor $G_C : \mathcal{E}_C \rightarrow (\mathcal{E}_C^\vee)^{\mathrm{op}}$. If λ satisfies condition (b) of Definition 8.6.3.1, then the construction $C \mapsto [G_C]$ determines a natural transformation of functors $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} \rightarrow \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}^{\mathrm{op}}$.

- 04DB **Corollary 8.6.3.9.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat}.$$

Let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration which exhibits U^\vee as a cocartesian dual of U . Then λ induces an isomorphism of functors $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} \xrightarrow{\sim} \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}^{\mathrm{op}}$, which carries each vertex $C \in \mathcal{C}$ to (the isomorphism class of) a functor which represents the balanced coupling $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$.

Proof. Combine Corollary 8.6.3.8 with Theorem 8.2.6.5. \square

- 04DC **Corollary 8.6.3.10.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat}.$$

If U^\vee is a cocartesian dual of U , then $\mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}$ is isomorphic to the functor

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}^{\mathrm{op}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}_C^{\mathrm{op}}.$$

- 04DD **Remark 8.6.3.11.** In §8.6.7, we will prove a stronger version of Corollary 8.6.3.10, which gives a reformulation of cocartesian duality in the language of transport representations (see Proposition 8.6.7.12).

For some applications, it will be convenient to work with a reformulation of Definition 8.6.3.1.

Definition 8.6.3.12. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial 04DE sets. We say that a morphism of simplicial sets $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}$ exhibits U^\vee as a cocartesian dual of U if the following conditions are satisfied:

- (a) For each vertex $C \in \mathcal{C}$, the induced map $\mathcal{K}_C : \mathcal{E}_C^\vee \times \mathcal{E}_C \rightarrow \mathcal{S}$ is a balanced profunctor (see Definition 8.3.2.18).
- (b) Let $f : X \rightarrow Y$ be a U -cocartesian edge of \mathcal{E} and let $f^\vee : X^\vee \rightarrow Y^\vee$ be a U^\vee -cocartesian edge of \mathcal{E}^\vee having the same image $e : C \rightarrow D$ in \mathcal{C} . Then the map of Kan complexes

$$\mathcal{K}(f^\vee, f) : \mathcal{K}_C(X^\vee, X) \rightarrow \mathcal{K}_D(Y^\vee, Y)$$

carries universal vertices of $\mathcal{K}_C(X^\vee, X)$ to universal vertices of $\mathcal{K}_D(Y^\vee, Y)$ (see Definition 8.3.2.7).

Variant 8.6.3.13. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial 04DF sets. In the formulation of Definition 8.6.3.12, we have implicitly assumed that for each vertex $C \in \mathcal{C}$, the ∞ -categories \mathcal{E}_C and \mathcal{C}_C^\vee are locally small (if this condition is not satisfied, then a balanced profunctor $\mathcal{K}_C : \mathcal{E}_C^\vee \times \mathcal{E}_C \rightarrow \mathcal{S}$ cannot exist). However, we will sometimes apply the theory of cocartesian duality in situations where this condition is not satisfied. If κ is an uncountable cardinal (not necessarily small), we will say that a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ exhibits U^\vee as a cocartesian dual of U if it satisfies conditions (a) and (b) of Definition 8.6.3.12. In this case, we can take κ to be any uncountable cardinal having the property that, for each vertex $C \in \mathcal{C}$, the ∞ -categories \mathcal{E}_C and \mathcal{E}_C^\vee are locally κ -small.

Remark 8.6.3.14. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial 04DG sets, let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration, and let $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ be a covariant transport representation for λ . Then λ exhibits U^\vee as a cocartesian dual of U (in the sense of Definition 8.6.3.1) if and only if \mathcal{K} exhibits U^\vee as a cocartesian dual of U (in the sense of Variant 8.6.3.13). See Remarks 8.3.2.19 and 8.3.2.8.

Combining Remark 8.6.3.14 with the classification of left fibrations (Corollary 5.7.0.6), we obtain the following:

Proposition 8.6.3.15. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of 04DH ∞ -categories. Let κ be an uncountable cardinal with the property that, for each vertex $C \in \mathcal{C}$, the ∞ -categories \mathcal{E}_C and \mathcal{E}_C^\vee are locally κ -small. Then U^\vee is a cocartesian dual of U if and only if there exists a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ which exhibits U^\vee as a cocartesian dual of U , in the sense of Definition 8.6.3.12.

We now give some examples of cocartesian duality.

- 04DJ **Proposition 8.6.3.16.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets, and set $\tilde{\mathcal{E}} = \mathcal{C} \times_{\text{Fun}(\Delta^1, \mathcal{E})} \text{Fun}(\Delta^1, \mathcal{E})$. Then the evaluation maps $\text{ev}_0, \text{ev}_1 : \tilde{\mathcal{E}} \rightarrow \mathcal{E}$ determine a left fibration $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{E}$ which exhibits U as a cocartesian dual of itself.*

Proof. The morphism λ is a pullback of the restriction map

$$\text{Fun}(\Delta^1, \mathcal{E}) \rightarrow \text{Fun}(\partial\Delta^1, \mathcal{E}) \times_{\text{Fun}(\partial\Delta^1, \mathcal{C})} \text{Fun}(\Delta^1, \mathcal{C}),$$

and is therefore a left fibration by virtue of Proposition 4.2.5.1. For every vertex $C \in \mathcal{C}$, we can identify λ_C with the coupling

$$\text{Fun}(\Delta^1, \mathcal{E}_C) \rightarrow \text{Fun}(\{0\}, \mathcal{E}_C) \times \text{Fun}(\{1\}, \mathcal{E}_C).$$

It follows from Example 8.2.6.3 that each λ_C is a balanced coupling, so that λ satisfies condition (a) of Definition 8.6.3.1. Moreover, every object of $\text{Fun}(\Delta^1, \mathcal{E}_C)$ is universal for the coupling λ_C , so that condition (b) of Definition 8.6.3.1 is vacuous. \square

- 04DK **Corollary 8.6.3.17.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets. Then U is a cocartesian dual of itself.*

- 04DL **Example 8.6.3.18.** In the special case $\mathcal{C} = \Delta^0$, Corollary 8.6.3.17 asserts that every Kan complex $X = \mathcal{E}$ is homotopy equivalent to the opposite Kan complex X^{op} . This can also be deduced from Theorem 3.5.0.1, since the geometric realizations $|X|$ and $|X^{\text{op}}|$ are homeomorphic.

- 04DM **Proposition 8.6.3.19.** *Let \mathcal{C} be a category, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories, and let $\mathcal{F}' : \mathcal{C} \rightarrow \mathbf{Cat}$ be the functor given on objects by $C \mapsto \mathcal{F}(C)^{\text{op}}$. Then (the nerves of) the fibrations*

$$\int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C} \quad \int_{\mathcal{C}} \mathcal{F}' \rightarrow \mathcal{C}$$

are cocartesian dual to one another.

We will deduce Proposition 8.6.3.19 from a more precise result. To formulate it, we need to introduce a bit of notation.

- 04DN **Construction 8.6.3.20.** Let \mathcal{C} be a category, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories, and let $\int_{\mathcal{C}} \mathcal{F}$ denote the category of elements of \mathcal{F} (Definition 5.7.1.1); we identify objects of $\int_{\mathcal{C}} \mathcal{F}$ with pairs (C, X) , where C is an object of \mathcal{C} and X is an object of the category $\mathcal{F}(C)$. Let $\mathcal{F}' : \mathcal{C} \rightarrow \mathbf{Cat}$ denote the functor given on objects by $\mathcal{F}'(C) = \mathcal{F}(C)^{\text{op}}$. We define a functor

$$\mathcal{K} : \int_{\mathcal{C}} \mathcal{F}' \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F} \rightarrow \text{Set}$$

as follows:

- On objects, \mathcal{K} is given by the formula $\mathcal{K}((C, X'), (C, X)) = \text{Hom}_{\mathcal{F}(C)}(X', X)$.
- Let $f : (C, X) \rightarrow (D, Y)$ be a morphism in the category $\int_{\mathcal{C}} \mathcal{F}$ and let $f' : (C, X') \rightarrow (D, Y')$ be a morphism in the category $\int_{\mathcal{C}} \mathcal{F}'$ having the same image $u : C \rightarrow D$ in \mathcal{B} . Let us identify f and f' with morphisms $g : \mathcal{F}(u)(X) \rightarrow Y$ and $g' : Y' \rightarrow \mathcal{F}(u)(Y)$ in the category $\mathcal{F}(D)$. Then the function $\mathcal{K}(f', f) : \mathcal{K}((C, X'), (C, X)) \rightarrow \mathcal{K}((D, Y'), (D, Y))$ is given by the composition

$$\text{Hom}_{\mathcal{F}(C)}(X', X) \xrightarrow{\mathcal{F}(u)} \text{Hom}_{\mathcal{F}(D)}(\mathcal{F}(u)(X'), \mathcal{F}(u)(X)) \xrightarrow{g \circ \bullet \circ g'} \text{Hom}_{\mathcal{F}(D)}(Y', Y).$$

Proposition 8.6.3.21. *Let \mathcal{C} be a category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories. 04DP Then the functor*

$$N_{\bullet}(\mathcal{K}) : N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}') \times_{N_{\bullet}(\mathcal{C})} N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}) \rightarrow N_{\bullet}(\text{Set}) \subset \mathcal{S}$$

of Construction 8.6.3.20 exhibits the projection map $U' : N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}') \rightarrow N_{\bullet}(\mathcal{C})$ as a cocartesian dual of the projection map $U : N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}) \rightarrow N_{\bullet}(\mathcal{C})$.

Proof. For each object $C \in \mathcal{C}$, the restriction of \mathcal{K} to the fiber over C is given concretely by the functor

$$\mathcal{K}_C : \mathcal{F}(C)^{\text{op}} \times \mathcal{F}(C) \rightarrow \text{Set} \quad (X', X) \mapsto \text{Hom}_{\mathcal{F}(C)}(X', X).$$

Example 8.3.3.4 implies that $N_{\bullet}(\mathcal{K}_C)$ is a Hom-functor for the ∞ -category $N_{\bullet}(\mathcal{F}(C))$ and is therefore a balanced profunctor (Proposition 8.3.3.8). Let $u : C \rightarrow D$ be a morphism in the category \mathcal{C} , and let $f : (C, X) \rightarrow (D, Y)$ and $f' : (C, X') \rightarrow (D, Y')$ be lifts of u to the categories $\int_{\mathcal{C}} \mathcal{F}$ and $\int_{\mathcal{C}} \mathcal{F}'$, respectively. We wish to show that, if f is U -cocartesian and f' is U' -cocartesian, then the induced map

$$\mathcal{K}(f, f') : \mathcal{K}_C(X', X) \rightarrow \mathcal{K}_D(Y', Y)$$

carries universal elements of $\mathcal{K}_C(X', X)$ to universal elements of $\mathcal{K}_D(Y', Y)$. Let us identify f and f' with morphisms $g : \mathcal{F}(u)(X) \rightarrow Y$ and $g' : Y' \rightarrow \mathcal{F}(u)(Y)$ in the category $\mathcal{F}(D)$, so that $\mathcal{K}(f', f)$ is given by the composition

$$\text{Hom}_{\mathcal{F}(C)}(X', X) \xrightarrow{\mathcal{F}(u)} \text{Hom}_{\mathcal{F}(D)}(\mathcal{F}(u)(X'), \mathcal{F}(u)(X)) \xrightarrow{g \circ \bullet \circ g'} \text{Hom}_{\mathcal{F}(D)}(Y', Y).$$

Our assumption that f is U -cocartesian guarantees that g is an isomorphism in the category $\mathcal{F}(D)$, and our assumption that f' is a U' -cocartesian guarantees that g' is an isomorphism in the category $\mathcal{F}(D)$. The desired result now follows from the observation that if $e : X' \rightarrow X$ is an isomorphism in the category $\mathcal{F}(C)$, then the composition $g \circ \mathcal{F}(u)(e) \circ g'$ is an isomorphism in the category $\mathcal{F}(D)$. \square

Proof of Proposition 8.6.3.19. Combine Propositions 8.6.3.15 and 8.6.3.21. \square

Let QCat be the (ordinary) category of ∞ -categories, which we regard as a full subcategory of Set_Δ . If $\mathcal{F} : \mathcal{C} \rightarrow \text{QCat}$ is a functor of ordinary categories, we let $N_\bullet^{\mathcal{F}}(\mathcal{C})$ denote the weighted nerve of Definition 5.3.3.1. According to Corollary 5.3.3.16, the projection map $U : N_\bullet^{\mathcal{F}}(\mathcal{C}) \rightarrow N_\bullet(\mathcal{C})$ is a cocartesian fibration, whose fiber over an object $C \in \mathcal{C}$ can be identified with the ∞ -category $\mathcal{F}(C)$. In this situation, it is easy to construct a cocartesian dual of U :

04DQ **Proposition 8.6.3.22.** *Let $\mathcal{F} : \mathcal{C} \rightarrow \text{QCat}$ be a functor of ordinary categories, and let $\mathcal{F}' : \mathcal{C} \rightarrow \text{QCat}$ denote the functor given on objects by $C \mapsto \mathcal{F}(C)^{\text{op}}$. Then the fibrations*

$$N_\bullet^{\mathcal{F}}(\mathcal{C}) \rightarrow N_\bullet(\mathcal{C}) \leftarrow N_\bullet^{\mathcal{F}'}(\mathcal{C})$$

are cocartesian dual to one another.

Proposition 8.6.3.22 is an immediate consequence of the following more precise result:

04DR **Proposition 8.6.3.23.** *Let $\mathcal{F} : \mathcal{C} \rightarrow \text{QCat}$ be a functor of ordinary categories and let $\mathcal{F}', \text{Tw}(\mathcal{F}) : \mathcal{C} \rightarrow \text{QCat}$ be the functors given on objects by the formulae $\mathcal{F}'(C) = \mathcal{F}(C)^{\text{op}}$ and $\text{Tw}(\mathcal{F})(C) = \text{Tw}(\mathcal{F}(C))$. Then the tautological map*

$$\lambda = (\lambda_-, \lambda_+) : N_\bullet^{\text{Tw}(\mathcal{F})}(\mathcal{C}) \rightarrow N_\bullet^{\mathcal{F}^{\text{op}}}(\mathcal{C}) \times_{N_\bullet(\mathcal{C})} N_\bullet^{\mathcal{F}}(\mathcal{C})$$

exhibits the fibration $U^\vee : N_\bullet^{\mathcal{F}'}(\mathcal{C}) \rightarrow N_\bullet(\mathcal{C})$ as a cocartesian dual of the fibration $U : N_\bullet^{\mathcal{F}}(\mathcal{C}) \rightarrow N_\bullet(\mathcal{C})$.

Proof. For each object $C \in \mathcal{C}$, Proposition 8.1.1.11 guarantees that the morphism

$$\lambda_C : \text{Tw}(\mathcal{F}(C)) \rightarrow \mathcal{F}(C)^{\text{op}} \times \mathcal{F}(C)$$

is a left fibration of ∞ -categories, which is a balanced coupling by virtue of Example 8.2.6.2. Applying Corollary 5.3.3.17, we deduce that λ is a left fibration of ∞ -categories. Let $U : N_\bullet^{\text{Tw}(\mathcal{F})}(\mathcal{C}) \rightarrow N_\bullet(\mathcal{C})$ denote the projection map, and let $f : X \rightarrow Y$ be a morphism in the ∞ -category $N_\bullet^{\text{Tw}(\mathcal{F})}(\mathcal{C})$ having image $u : C \rightarrow D$ in \mathcal{C} . To complete the proof, it will suffice to show that if X is universal for the coupling λ_C and f is U -cocartesian, then Y is universal for the coupling λ_D . Our assumption that f is U -cocartesian guarantees that Y is isomorphic to the image of X under the functor $\text{Tw}(\mathcal{F}(u)) : \text{Tw}(\mathcal{F}(C)) \rightarrow \text{Tw}(\mathcal{F}(D))$. The desired result now follows from Example 8.2.1.5, since the functor $\mathcal{F}(u)$ carries isomorphisms in the ∞ -category $\mathcal{F}(C)$ to isomorphisms in the ∞ -category $\mathcal{F}(D)$. \square

8.6.4 Existence of Dual Fibrations

The goal of this section is to prove the following:

04DS

Theorem 8.6.4.1. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, which is uniquely determined up to equivalence.*

We will give the proof of Theorem 8.6.4.1 at the end of this section.

Corollary 8.6.4.2. *For every simplicial set \mathcal{C} , the formation of cocartesian duals induces a bijection*

$$\begin{array}{ccc} \{\text{Cocartesian fibrations } U : \mathcal{E} \rightarrow \mathcal{C}\}/\text{Equivalence} & & \\ \downarrow \theta & & \\ \{\text{Cocartesian fibrations } U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}\}/\text{Equivalence}. & & \end{array}$$

Proof. Theorem 8.6.4.1 implies that θ is well-defined, and Remark 8.6.3.3 implies that $\theta \circ \theta$ is the identity; in particular, θ is a bijection. \square

Variant 8.6.4.3 (Cartesian Duality). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be cartesian fibrations of simplicial sets. We say that U' is a cartesian dual of U if the cocartesian fibration $U'^{\text{op}} : \mathcal{E}'^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cocartesian dual of $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$. It follows from Theorem 8.6.4.1 that every cartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ admits a cartesian dual $U' : \mathcal{E} \rightarrow \mathcal{C}$ which is uniquely determined up to equivalence. Moreover, Corollary 8.6.3.10 implies that the (contravariant) homotopy transport representation of U' is given by the composition

$$\text{h}\mathcal{C}^{\text{op}} \xrightarrow{\text{hTr}_{\mathcal{E}/\mathcal{C}}} \text{hQCat} \xrightarrow{\mathcal{A} \mapsto \mathcal{A}^{\text{op}}} \text{hQCat}.$$

In particular, for every vertex $C \in \mathcal{C}$, the fiber $\mathcal{E}'_C \{C\} \times_{\mathcal{C}} \mathcal{E}'$ is equivalent to the opposite of the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$.

Warning 8.6.4.4. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets which is both a cartesian fibration and a cocartesian fibration. Then U admits both a cocartesian dual $U' : \mathcal{E}' \rightarrow \mathcal{C}$ and a cartesian dual $U'' : \mathcal{E}'' \rightarrow \mathcal{C}$. For every vertex $C \in \mathcal{C}$, there are equivalences of ∞ -categories $\mathcal{E}'_C \simeq \mathcal{E}_C^{\text{op}} \simeq \mathcal{E}''_C$. Beware that the fibrations U' and U'' are generally not equivalent to one another (see Example 8.6.4.5).

Example 8.6.4.5. Let $U : \mathcal{E} \rightarrow \Delta^1$ be a cocartesian fibration of ∞ -categories. By virtue of Remark 5.2.4.3, the cocartesian fibration U can be recovered (up to equivalence) from its homotopy transport representation, which we can identify with the functor $F : \mathcal{E}_0 \rightarrow \mathcal{E}_1$ given by covariant transport along the nondegenerate edge of Δ^1 . The fibration U then a

cocartesian dual $U' : \mathcal{E}' \rightarrow \Delta^1$, whose covariant transport functor can be identified with the composition

$$\mathcal{E}'_0 \simeq \mathcal{E}_0^{\text{op}} \xrightarrow{F^{\text{op}}} \mathcal{E}_1^{\text{op}} \simeq \mathcal{E}'_1$$

(Corollary 8.6.3.10). Applying Proposition 6.2.3.5, we deduce the following:

- (a) The cocartesian fibration U is a cartesian fibration if and only if the functor $F : \mathcal{E}_0 \rightarrow \mathcal{E}_1$ admits a right adjoint.
- (b) The cocartesian fibration U' is a cartesian fibration if and only if the functor $F^{\text{op}} : \mathcal{E}_0^{\text{op}} \rightarrow \mathcal{E}_1^{\text{op}}$ admits a right adjoint: that is, if and only if the functor F admits a left adjoint.

Note that conditions (a) and (b) are not equivalent. If (a) is satisfied and (b) is not, then U admits a cartesian dual $U'' : \mathcal{E}'' \rightarrow \Delta^1$ which cannot be equivalent to U' (since U'' is a cartesian fibration and U' is not).

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Theorem 8.6.4.1 implies that U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$. To prove this, it will be convenient to use the formulation of cocartesian duality supplied by Definition 8.6.3.12. In the special case where $\mathcal{C} = \Delta^0$ and \mathcal{E} is locally small, we wish to show that there exists an ∞ -category \mathcal{E}^\vee and a balanced profunctor $\mathcal{K} : \mathcal{E}^\vee \times \mathcal{E} \rightarrow \mathcal{S}$. This is a special case of Corollary 8.3.2.21: in fact, we can take \mathcal{E}^\vee to be the ∞ -category $\text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S})$ of corepresentable functors from \mathcal{E} to \mathcal{S} , and \mathcal{K} to be the evaluation functor

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S}) \times \mathcal{E} \rightarrow \mathcal{S} \quad (\mathcal{F}, X) \mapsto \mathcal{F}(X).$$

To handle the general case we will use a variant of this construction, defined using the relative exponential introduced in §4.5.9.

04DY Construction 8.6.4.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, let κ be an uncountable cardinal, and let $\mathcal{S}^{<\kappa}$ denote the ∞ -category of essentially κ -small spaces. We let $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ denote the relative exponential of Construction 4.5.9.1. By construction, we can identify vertices of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ with pairs (C, \mathcal{F}_C) , where C is a vertex of \mathcal{C} and $\mathcal{F}_C : \mathcal{E}_C \rightarrow \mathcal{S}^{<\kappa}$ is a functor of ∞ -categories. We let $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ denote the full simplicial subset of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ spanned by those vertices (C, \mathcal{F}_C) where the functor \mathcal{F}_C is corepresentable by an object of the ∞ -category \mathcal{E}_C . In what follows, we will generally write $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ for the projection map, and $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ for the restriction of π to the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$.

04DZ Remark 8.6.4.7. Construction 8.6.4.6 is independent of the choice of the cardinal κ , provided that each of the ∞ -categories \mathcal{E}_C is locally κ -small. If this condition is satisfied and $\lambda \geq \kappa$, then every corepresentable functor $\mathcal{F} : \mathcal{E}_C \rightarrow \mathcal{S}^{<\lambda}$ factors through $\mathcal{S}^{<\kappa}$. It follows that $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) = \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\lambda})$.

The existence assertion of Theorem 8.6.4.1 is a consequence of the following more precise result:

Proposition 8.6.4.8. *Let κ be an uncountable cardinal and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets which is locally κ -small (Variant 5.4.9.2). Then the evaluation map*

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa} \quad ((C, \mathcal{F}_C), X) \mapsto \mathcal{F}_C(X)$$

exhibits the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ as a cocartesian dual of U (in the sense of Variant 8.6.3.13).

Our first goal is to show that, in the situation of Proposition 8.6.4.8, the projection map π^{corep} is a cocartesian fibration of simplicial sets. We begin with some more general remarks.

Proposition 8.6.4.9. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ -small, and let \mathcal{D} be an ∞ -category which is κ -cocomplete. Then the projection map $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets.*

Proof. It follows from Corollary 5.3.6.8 that π is a cartesian fibration of simplicial sets. Let $e : C \rightarrow C'$ be an edge of the simplicial set \mathcal{C} , and let $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ be the functor given by covariant transport along e (for the cocartesian fibration U). Then precomposition with $e_!$ determines a functor

$$e^* : \{C'\} \times_{\mathcal{C}} \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) = \text{Fun}(\mathcal{E}_{C'}, \mathcal{D}) \xrightarrow{\circ e_!} \text{Fun}(\mathcal{E}_C, \mathcal{D}) = \{C\} \times_{\mathcal{C}} \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}).$$

Proposition 5.3.6.9 guarantees that the functor e^* is given by contravariant transport along e (for the cartesian fibration π). Using Proposition 6.2.3.5, we see that π is a cocartesian fibration if and only if the functor e^* has a left adjoint (for every edge e of \mathcal{C}). By virtue of Corollary 7.3.6.3, it will suffice to show that every functor $F : \mathcal{E}_C \rightarrow \mathcal{D}$ admits a left Kan extension along the functor $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$. This is a special case of Proposition 7.6.7.13, by virtue of our assumptions on the cardinal κ . \square

Remark 8.6.4.10. In the situation of Proposition 8.6.4.9, let $e : C \rightarrow C'$ be an edge of \mathcal{C} and let

$$e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'} \quad e'_! : \text{Fun}(\mathcal{E}_C, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{E}_{C'}, \mathcal{D})$$

be functors given by covariant transport along e (for the cocartesian fibrations U and π , respectively). Then the functor $e'_!$ is given by left Kan extension along $e_!$.

Variant 8.6.4.11. Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an exponentiable inner fibration which is essentially κ -small, and let \mathcal{D} be an ∞ -category which is κ -cocomplete. Then the projection map $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \rightarrow \mathcal{C}$ is a cocartesian fibration. Moreover, an edge \tilde{e} of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ is π -cocartesian if and only if satisfies the following condition:

- (*) Write $\tilde{e} = (e, F_e)$, where e is an edge of \mathcal{C} and $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$ is a functor of ∞ -categories. Then F_e is left Kan extended from the full subcategory $\{0\} \times_{\mathcal{C}} \mathcal{E}$.

Proof. Corollary 4.5.9.18 guarantees that π is an isofibration, and Corollary 7.3.7.9 guarantees that every edge of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ which satisfies condition (*) is π -cocartesian. Suppose we are given a vertex $\tilde{C} = (C, F_C)$ of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$, where C is a vertex of \mathcal{C} and $F_C : \mathcal{E}_C \rightarrow \mathcal{D}$ is a functor of ∞ -categories. If $e : C \rightarrow C'$ is an edge of \mathcal{C} , then Proposition 7.6.7.13 guarantees that F_C admits a left Kan extension $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$, which we can identify with an edge \tilde{e} of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ satisfying $\pi(\tilde{e}) = e$. By construction, the morphism \tilde{e} satisfies condition (*), and is therefore π -cocartesian by virtue of Corollary 7.3.7.9. Allowing \tilde{C} and e to vary, we conclude that π is a cocartesian fibration. To complete the proof, it will suffice to show that every π -cocartesian edge \tilde{e}' of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ satisfies condition (*). Let us identify \tilde{e}' with a pair (e, F'_e) , where e is an edge of \mathcal{B} and $F'_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$ is a functor. Using the preceding argument, we see that the restriction $F'_e|_{\{0\} \times_{\mathcal{C}} \mathcal{E}}$ admits a left Kan extension $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$, corresponding to another edge \tilde{e} of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$. By construction, \tilde{e} satisfies condition (*) and is therefore π -cocartesian. Invoking the uniqueness of cocartesian lifts (Remark 5.1.3.8), we deduce that the functors F_e and F'_e are isomorphic. It follows that F'_e is also left Kan extended from $\{0\} \times_{\mathcal{C}} \mathcal{E}$ (Remark 7.3.3.16), so that \tilde{e}' satisfies condition (*) as desired. \square

04E4 **Proposition 8.6.4.12.** *Let κ be an uncountable regular cardinal and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ -small. Then:*

- (1) *The projection map $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ is both a cartesian fibration and a cocartesian fibration.*
- (2) *Let \tilde{e} be a π -cocartesian edge of the simplicial set $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. If the source of \tilde{e} belongs to the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$, then the target of \tilde{e} also belongs to the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$.*
- (3) *The morphism π restricts to a cocartesian fibration $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$. Moreover, an edge of $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ is π^{corep} -cocartesian if and only if it is π -cocartesian.*

Proof. Assertion (1) follows from Corollary 5.3.6.8 and Proposition 8.6.4.9 (since the ∞ -category $\mathcal{S}^{<\kappa}$ admits κ -small colimits; see Remark 7.4.5.7). We will prove (2). Let $\tilde{e} : (C, \mathcal{F}_C) \rightarrow (C', \mathcal{F}_{C'})$ be an edge of the simplicial set $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ having image $e : C \rightarrow C'$ in \mathcal{C} . Let $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ be given by covariant transport along e for the cocartesian fibration U . If \tilde{e} is π -cocartesian, then we can identify $\mathcal{F}_{C'}$ with a left Kan extension of \mathcal{F}_C along the functor $e_!$ (Remark 8.6.4.10). In particular, if the functor $\mathcal{F}_C : \mathcal{E}_C \rightarrow \mathcal{S}$ is corepresentable by an object $X \in \mathcal{E}_C$, then $\mathcal{F}_{C'}$ is corepresentable by the image $e_!(X) \in \mathcal{E}_{C'}$ (Corollary

8.3.1.9). This proves assertion (2), and assertion (3) is a formal consequence (see Proposition 5.1.4.16). \square

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. To show that the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ is a cocartesian fibration (at least for $\kappa \gg 0$), we used the fact that the collection of corepresentable functors is closed under the formation of left Kan extensions. To prove Proposition 8.6.4.8, we will need to characterize the collection of π^{corep} -cocartesian edges of the simplicial set $\text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})$ more explicitly.

Lemma 8.6.4.13. *Let κ be an uncountable cardinal, let \mathcal{E} be an ∞ -category which is locally κ -small, and let $\mathcal{F} : \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ be a functor. Suppose we are given a full subcategory $\mathcal{E}_0 \subseteq \mathcal{E}$, an object $X \in \mathcal{E}_0$, and a vertex $\eta \in \mathcal{F}(X)$. Then η exhibits the \mathcal{F} as corepresented by the object X if and only if the following conditions are satisfied:*

- (a) *The vertex η exhibits $\mathcal{F}_0 = \mathcal{F}|_{\mathcal{E}_0}$ as corepresented by the object X .*
- (b) *The functor \mathcal{F} is left Kan extended from \mathcal{E}_0 .*

Proof. It follows immediately from the definition that if η exhibits \mathcal{F} as corepresented by X , then it also exhibits \mathcal{F}_0 as corepresented by X . We may therefore assume without loss of generality that condition (a) is satisfied. In this case, the desired equivalence follows immediately by combining the criterion of Lemma 8.3.1.7 with the transitivity property of Kan extensions (Proposition 7.3.8.18). \square

Lemma 8.6.4.14. *Let κ be an uncountable cardinal, let \mathcal{E} be an ∞ -category which is locally κ -small, and let $\mathcal{F} : \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ be a functor. Suppose we are given a functor $U : \mathcal{E} \rightarrow \Delta^1$ and a U -cocartesian morphism $e : X \rightarrow Y$ of \mathcal{E} satisfying $U(X) = 0$ and $U(Y) = 1$. Write $\mathcal{E}_0 = \{0\} \times_{\Delta^1} \mathcal{E}$ and $\mathcal{E}_1 = \{1\} \times_{\Delta^1} \mathcal{E}$, and let $\eta \in \mathcal{F}(X)$ be a vertex which exhibits the functor $\mathcal{F}_0 = \mathcal{F}|_{\mathcal{E}_0}$ as corepresented by the object X . The following conditions are equivalent:*

- (1) *The functor \mathcal{F} is left Kan extended from \mathcal{E}_0 .*
- (2) *The vertex η exhibits the functor \mathcal{F} as corepresented by X .*
- (3) *The vertex $\mathcal{F}(e)(\eta) \in \mathcal{F}(Y)$ exhibits the functor $\mathcal{F}_1 = \mathcal{F}|_{\mathcal{E}_1}$ as corepresented by the object $Y \in \mathcal{E}_1$.*

Proof. The equivalence of (1) and (2) follows from Lemma 8.6.4.13. We will show that (2)

and (3) are equivalent. Fix an object $Z \in \mathcal{E}_1$. Then the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{E}_1}(Y, Z) & \xrightarrow{\circ[e]} & \mathrm{Hom}_{\mathcal{E}}(X, Z) \\ & \searrow & \swarrow \\ & \mathcal{F}(Z) & \end{array}$$

commutes up to homotopy, where the right vertical map is determined by $\eta\mathcal{F}(X)$ and the left vertical map is determined by $\mathcal{F}(e)(\eta) \in \mathcal{F}(Y)$. Our assumption that e is U -cocartesian guarantees that the horizontal map is a homotopy equivalence (Corollary 5.1.2.3). It follows that the left vertical map is a homotopy equivalence if and only if the right vertical map is a homotopy equivalence. The desired result now follows by allowing the object Z to vary. \square

04E7 **Lemma 8.6.4.15.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let κ be an uncountable cardinal such that each fiber of U is locally κ -small. Let \tilde{e} be an edge of the simplicial set $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ corresponding to a pair (e, \mathcal{F}) , where $e : C \rightarrow D$ is an edge of \mathcal{C} and $\mathcal{F} : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ is a functor. The following conditions are equivalent:*

- (1) *The edge \tilde{e} is π^{corep} -cocartesian (where $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ denotes the projection map).*
- (2) *There exists an object $X \in \mathcal{E}_C$, a vertex $\eta \in \mathcal{F}(X)$ which exhibits $\mathcal{F}|_{\mathcal{E}_C}$ as corepresented by the object X , and a U -cocartesian morphism $\bar{e} : X \rightarrow Y$ such that $U(\bar{e}) = e$ and the vertex $\mathcal{F}(\bar{e})(\eta) \in \mathcal{F}(Y)$ exhibits $\mathcal{F}|_{\mathcal{E}_D}$ as corepresented by the object Y .*
- (3) *For every object $X \in \mathcal{E}_C$, every vertex $\eta \in \mathcal{F}(X)$ which exhibits $\mathcal{F}|_{\mathcal{E}_C}$ as corepresented by the object X , and every U -cocartesian morphism $\bar{e} : X \rightarrow Y$ satisfying $U(\bar{e}) = e$, the vertex $\mathcal{F}(\bar{e})(\eta) \in \mathcal{F}(Y)$ exhibits $\mathcal{F}|_{\mathcal{E}_D}$ as corepresented by the object Y .*

Proof. By virtue of Remark 8.6.4.7, we are free to enlarge the cardinal κ ; we may therefore assume without loss of generality that κ is regular and that the ∞ -category $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ is essentially κ -small. In this case, Variant 8.6.4.11 shows that (1) is equivalent to the following:

- (1') *The functor \mathcal{F} is left Kan extended from the full subcategory $\mathcal{E}_C \subseteq \Delta^1 \times_{\mathcal{C}} \mathcal{E}$.*

The equivalences (1') \Leftrightarrow (2) \Leftrightarrow (3) now follow from Lemma 8.6.4.14. \square

Proof of Proposition 8.6.4.8. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let κ be an uncountable cardinal such that each fiber of U is locally κ -small. It follows

from Proposition 8.6.4.12 that the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets. We wish to show that the evaluation map

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa} \quad ((C, \mathcal{F}_C), X) \mapsto \mathcal{F}_C(X)$$

satisfies conditions (a) and (b) of Definition 8.6.3.12. Condition (a) asserts that, for each vertex $C \in \mathcal{C}$, the evaluation map

$$\text{ev}_C : \text{Fun}^{\text{corep}}(\mathcal{E}_C, \mathcal{S}^{<\kappa}) \times \mathcal{E}_C \rightarrow \mathcal{S}^{<\kappa} \quad (\mathcal{F}, X) \mapsto \mathcal{F}(X)$$

is a balanced profunctor; this follows from Corollary 8.3.2.21. Assertion (b) is a restatement of the implication (1) \Rightarrow (3) of Lemma 8.6.4.15. \square

Proposition 8.6.4.8 immediately implies the existence assertion of Theorem 8.6.4.1. To establish uniqueness, it will be convenient to introduce some terminology.

Definition 8.6.4.16. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets and let κ be an uncountable cardinal. We will say that a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ 04E8 is a *weak \mathcal{C} -family of corepresentable profunctors* if, for every vertex $C \in \mathcal{C}$, the induced map

$$\mathcal{K}_C : \mathcal{E}_C^\vee \times \mathcal{E}_C \rightarrow \mathcal{S}^{<\kappa}$$

is a corepresentable profunctor (Definition 8.3.2.9). We say that \mathcal{K} is a *\mathcal{C} -family of corepresentable profunctors* if it is a weak \mathcal{C} -family of corepresentable profunctors and satisfies the following additional condition:

- (*) Let $f : X \rightarrow Y$ be a U -cocartesian edge of \mathcal{E} and let $f^\vee : X^\vee \rightarrow Y^\vee$ be a U^\vee -cocartesian edge of \mathcal{E}^\vee having the same image $u : C \rightarrow D$ in \mathcal{C} . Then the map of Kan complexes

$$\mathcal{K}(f^\vee, f) : \mathcal{K}_C(X^\vee, X) \rightarrow \mathcal{K}_D(Y^\vee, Y)$$

carries couniversal vertices of $\mathcal{K}_C(X^\vee, X)$ to couniversal vertices of $\mathcal{K}_D(Y^\vee, Y)$.

Example 8.6.4.17. In the situation of Definition 8.6.4.16, the morphism \mathcal{K} exhibits U^\vee 04E9 as a cocartesian dual of U (in the sense of Variant 8.6.3.13) if and only if it is a \mathcal{C} -family of corepresentable profunctors having the further property that each of the profunctors \mathcal{K}_C is *balanced*: that is, it is corepresentable by an equivalence of ∞ -categories $(\mathcal{E}_C^\vee)^{\text{op}} \rightarrow \mathcal{E}_C$ (see Corollary 8.3.2.20).

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets, let κ be an uncountable cardinal, and let $\pi : \text{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ denote the projection map. For any morphism of simplicial sets $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, we can identify morphisms $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ with morphisms $F : \mathcal{E}^\vee \rightarrow \text{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})$ satisfying $\pi \circ F = U$.

04EA Proposition 8.6.4.18. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. Let κ be an uncountable cardinal such that U is locally κ -small. Fix a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$, which we identify with a morphism $F : \mathcal{E}^\vee \rightarrow \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. Then:*

- (1) *The morphism \mathcal{K} is a weak \mathcal{C} -family of corepresentable profunctors if and only if F factors through the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$.*
- (2) *The morphism \mathcal{K} is a \mathcal{C} -family of corepresentable profunctors if and only if F factors through $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ and carries U^\vee -cocartesian edges of \mathcal{E}^\vee to π^{corep} -cocartesian edges of $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. Here $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ denotes the cocartesian fibration of Proposition 8.6.4.12.*
- (3) *The morphism \mathcal{K} exhibits U^\vee as a cocartesian dual of U if and only if $F : \mathcal{E}^\vee \rightarrow \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$ is an equivalence of cocartesian fibrations over \mathcal{C} .*

Proof. Assertion (1) is immediate from the definitions and assertion (2) follows from Lemma 8.6.4.15. Assertion (3) follows by combining (2) with Example 8.6.4.17 (see Proposition 5.1.7.14). \square

Proof of Theorem 8.6.4.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Fix an uncountable cardinal κ such that U is locally κ -small. Proposition 8.6.4.8 implies that the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa}) \rightarrow \mathcal{C}$ is a cocartesian dual of U , and Proposition 8.6.4.18 implies that any other cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is equivalent to π^{corep} . \square

Using Proposition 8.6.4.18, we can characterize the dual of a fibration by a universal mapping property.

04EB Corollary 8.6.4.19. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$, $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, and $V : \mathcal{D} \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, let κ be an uncountable cardinal, and let $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ exhibit U^\vee as a cocartesian dual of U . Then:*

- (1) *Composition with \mathcal{K} induces a fully faithful functor*

$$\text{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^\vee) \rightarrow \text{Fun}(\mathcal{D} \times_{\mathcal{C}} \mathcal{E}^\vee, \mathcal{S}^{<\kappa}).$$

The essential image is spanned by the weak \mathcal{C} -families of corepresentable profunctors.

- (2) *A morphism $F \in \text{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^\vee)$ carries V -cocartesian edges of \mathcal{D} to U^\vee -cocartesian edges of \mathcal{E}^\vee if and only if the composite map*

$$\mathcal{D} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{F \times \text{id}} \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \xrightarrow{\mathcal{K}} \mathcal{S}^{<\kappa}$$

is a \mathcal{C} -family of corepresentable profunctors.

- (3) A morphism $F \in \text{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^\vee)$ is an equivalence of cocartesian fibrations over \mathcal{C} if and only if the composite map

$$\mathcal{D} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{F \times \text{id}} \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \xrightarrow{\mathcal{K}} \mathcal{S}^{<\kappa}$$

exhibits V as a cocartesian dual of U

Proof. We can identify \mathcal{K} with a morphism $G \in \text{Fun}_{/\mathcal{C}}(\mathcal{E}^\vee, \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}))$. It follows from Proposition 8.6.4.18 that G is an equivalence of cocartesian fibrations over \mathcal{C} . We can therefore replace \mathcal{E}^\vee by $\text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa})$ and \mathcal{K} by the evaluation map $\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$. In this case, assertions (1), (2), and (3) follow immediately from the corresponding assertions of Proposition 8.6.4.18. \square

8.6.5 Cocartesian Duality via Cospans

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Theorem 8.6.4.1 asserts that U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, which is uniquely determined up to equivalence. In this section, we describe an alternative construction of U^\vee due to Barwick-Glasman-Nardin ([3]), which uses the restricted cospan construction of §8.1.6.

Notation 8.6.5.1. Let \mathcal{C} be a simplicial set, and let $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}(\mathcal{C})$ be the inclusion map of Construction 8.1.7.1. For every morphism of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$, we let $\text{Cospan}(\mathcal{E}/\mathcal{C})$ denote the fiber product $\mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}(\mathcal{E})$.

Suppose that U is a cocartesian fibration, and let L be the collection of all U -cocartesian morphisms of \mathcal{E} . In this case, we define $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C})$ to be the fiber product $\mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{L,\text{all}}(\mathcal{E})$, which we regard as a simplicial subset of $\text{Cospan}(\mathcal{E}/\mathcal{C})$.

Remark 8.6.5.2. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets. Low-dimensional simplices of the simplicial set $\text{Cospan}(\mathcal{E}/\mathcal{C})$ can be described as follows:

- Vertices of the simplicial set $\text{Cospan}(\mathcal{E}/\mathcal{C})$ can be identified with vertices of the simplicial set \mathcal{E} .
- Let X and Y be vertices of $\text{Cospan}(\mathcal{E}/\mathcal{C})$. Then edges $e : X \rightarrow Y$ of $\text{Cospan}(\mathcal{E}/\mathcal{C})$ can be identified with pairs of edges $X \xrightarrow{f} B \xleftarrow{g} Y$ in the simplicial set \mathcal{E} having the property that $U(g)$ is a degenerate edge of \mathcal{C} . If U is a cocartesian fibration, then the edge e belongs to $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C})$ if and only if f is U -cocartesian.

Example 8.6.5.3. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets. If $\mathcal{C} = \Delta^0$, then $\text{Cospan}(\mathcal{E}/\mathcal{C})$ can be identified with the simplicial set $\text{Cospan}(\mathcal{E})$. If, in addition, U is a cocartesian fibration, then \mathcal{E} is an ∞ -category and $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C})$ can be identified with the simplicial subset $\text{Cospan}^{\text{iso},\text{all}}(\mathcal{E}) \subseteq \text{Cospan}(\mathcal{E})$ of Variant 8.1.7.14. In this case, Proposition 8.1.7.6 guarantees that $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C})$ is an ∞ -category which is equivalent to \mathcal{E}^{op} .

04EG **Remark 8.6.5.4** (Base Change). Suppose we are given a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E}' & \longrightarrow & \mathcal{E} \\ \downarrow U' & & \downarrow U \\ \mathcal{C}' & \xrightarrow{F} & \mathcal{C}. \end{array}$$

Then we have a canonical isomorphism $\text{Cospan}(\mathcal{E}' / \mathcal{C}') \simeq \mathcal{C}' \times_{\mathcal{C}} \text{Cospan}(\mathcal{E} / \mathcal{C})$. If U is a cocartesian fibration, then U' is also a cocartesian fibration, and we also obtain an isomorphism $\text{Cospan}^{\text{CCart}}(\mathcal{E}' / \mathcal{C}') \simeq \mathcal{C}' \times_{\mathcal{C}} \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})$. In particular, for each vertex $C \in \mathcal{C}$, the fiber $\{C\} \times_{\mathcal{C}} \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})$ is isomorphic to the ∞ -category $\text{Cospan}^{\text{iso,all}}(\mathcal{E}_C)$, which is equivalent to the ∞ -category $\mathcal{E}_C^{\text{op}}$.

04EH **Example 8.6.5.5** (Path Fibrations). Let \mathcal{C} be an ∞ -category, and let

$$\text{ev}_0, \text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$$

denote the functors given by evaluation at the vertices $0, 1 \in \Delta^1$. Then ev_0 is a cartesian fibration, and ev_1 is a cocartesian fibration (Example 5.3.7.4). Let L denote the collection of ev_1 -cartesian morphisms of $\text{Fun}(\Delta^1, \mathcal{C})$ (that is, the collection of morphisms f such that $\text{ev}_0(f)$ is an isomorphism of \mathcal{C}), and let R denote the collection of ev_0 -cocartesian morphisms of \mathcal{C} (that is, the collection of morphisms f such that $\text{ev}_1(f)$ is an isomorphism in \mathcal{C}). Applying the construction of Notation 8.6.5.1 to the cocartesian fibration ev_1 , we obtain an ∞ -category $\text{Cospan}^{\text{CCart}}(\text{Fun}(\Delta^1, \mathcal{C}) / \mathcal{C})$. The morphism Ξ of Construction 8.2.6.11 determines a morphism $\text{Tw}(\mathcal{C}) \rightarrow \text{Cospan}^{\text{CCart}}(\text{Fun}(\Delta^1, \mathcal{C}) / \mathcal{C})$ which fits into a commutative diagram

$$\begin{array}{ccccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\Xi} & \text{Cospan}^{\text{CCart}}(\text{Fun}(\Delta^1, \mathcal{C}) / \mathcal{C}) & \longrightarrow & \text{Cospan}^{L,R}(\text{Fun}(\Delta^1, \mathcal{C})) \\ \downarrow & & \downarrow & & \downarrow \text{ev}_0, \text{ev}_1 \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \longrightarrow & \text{Cospan}^{\text{iso,all}}(\mathcal{C}) \times \mathcal{C} & \longrightarrow & \text{Cospan}^{\text{iso,all}}(\mathcal{C}) \times \text{Cospan}^{\text{all,iso}}(\mathcal{C}). \end{array}$$

Here the right half of the diagram is a pullback square, the vertical maps are left fibrations (Proposition 8.1.1.11 and Lemma 8.2.6.10), the lower horizontal maps are equivalences of ∞ -categories (Proposition 8.1.7.6). Applying Proposition 8.2.6.13 (and Corollary 4.5.2.24), we deduce that the $\Xi : \text{Tw}(\mathcal{C}) \rightarrow \text{Cospan}^{\text{CCart}}(\text{Fun}(\Delta^1, \mathcal{C}) / \mathcal{C})$ is an equivalence of ∞ -categories.

We can now state our main result.

Theorem 8.6.5.6. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the 04EJ projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}$ is also a cocartesian fibration, which is a cocartesian dual of U .*

We will give the proof of Theorem 8.6.5.6 at the end of this section.

Corollary 8.6.5.7 (The Dual of a Path Fibration). *Let \mathcal{C} be an ∞ -category. Then the 04EK projection map $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ of Notation 8.1.1.6 is a cocartesian dual of the evaluation functor $\text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$.*

Proof. Combine Theorem 8.6.5.6 with Example 8.6.5.5. \square

The proof of Theorem 8.6.5.6 will require some preliminaries. Our first goal is to show that if $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration, then the projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}$ is also a cocartesian fibration.

Lemma 8.6.5.8. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let L denote the collection of all U -cocartesian morphisms of \mathcal{E} , and let R denote the collection of all morphisms $e : X \rightarrow Y$ of \mathcal{E} such that $U(e)$ is an isomorphism in \mathcal{C} . Then $\text{Cospan}(U) : \text{Cospan}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$ restricts to a cocartesian fibration of ∞ -categories $V : \text{Cospan}^{L,R}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$. Moreover, an edge $e : X \rightarrow Y$ of $\text{Cospan}^{L,R}(\mathcal{E})$ is V -cocartesian if and only if it satisfies the following condition:*

- (*) *The edge e corresponds to a cospan $X \xrightarrow{\ell} B \xleftarrow{r} Y$ in \mathcal{E} , where ℓ is U -cocartesian and r is an isomorphism.*

Proof. Let L_0 be the collection of all morphisms in \mathcal{C} , and let R_0 be the collection of all morphisms of \mathcal{C} . Then L_0 and R_0 are pushout-compatible, in the sense of Definition 8.1.6.5 (Example 8.1.6.6). Moreover, U is a Beck-Chevalley fibration relative to (R_0, L_0) (Example 8.1.10.8). Since $\text{Cospan}^{L_0, R_0}(\mathcal{C}) = \text{Cospan}^{\text{iso},\text{all}}(\mathcal{C})$ is an ∞ -category, the desired result follows from (the duals of) Theorem 8.1.10.9 and Remark 8.1.10.11. \square

Remark 8.6.5.9. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let L denote the collection of all U -cocartesian morphisms of \mathcal{E} , and let R denote the collection of all morphisms g of \mathcal{E} such that $U(g)$ is an isomorphism in \mathcal{C} . We then have a commutative diagram of pullback squares*

$$\begin{array}{ccccc}
 \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) & \longrightarrow & \text{Cospan}^{L,R}(\mathcal{E}) & \longrightarrow & \text{Cospan}^{L,\text{all}}(\mathcal{E}) \\
 \downarrow & & \downarrow & & \downarrow \\
 \mathcal{C} & \xrightarrow{\rho_+} & \text{Cospan}^{\text{all},\text{iso}}(\mathcal{C}) & \longrightarrow & \text{Cospan}(\mathcal{C}),
 \end{array}$$

where the vertical map in the middle is a cocartesian fibration (Lemma 8.6.5.8), and the horizontal map on the lower left is an equivalence of ∞ -categories (Proposition 8.1.7.6). It follows that the projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}$ is a cocartesian fibration of ∞ -categories. Moreover, Corollary 4.5.2.24 implies that the inclusion $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C}) \hookrightarrow \text{Cospan}^{L,R}(\mathcal{E})$ is an equivalence of ∞ -categories.

- 04EN **Lemma 8.6.5.10.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the projection map $U^\vee : \text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}$ is also a cocartesian fibration. Moreover, an edge $X \rightarrow Y$ of $\text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C})$ is U^\vee -cocartesian if and only if it corresponds to a cospan $X \xrightarrow{\ell} B \xleftarrow{r} Y$ in \mathcal{E} , where ℓ is U -cocartesian and r is an isomorphism in the ∞ -category $\{U(Y)\} \times_{\mathcal{C}} \mathcal{E}$.*

Proof. Using Proposition 5.1.4.7 and Remark 8.6.5.4, we can reduce to the case where $\mathcal{C} = \Delta^n$ is a standard simplex. In particular, \mathcal{C} is an ∞ -category. In this case, the desired result follows by combining Remark 8.6.5.9 with Lemma 8.6.5.8. \square

To show that $U^\vee : \text{Cospan}^{\text{CCart}}(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}$ is a cocartesian dual of U , we will need an auxiliary construction.

- 04EP **Notation 8.6.5.11.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let L denote the collection of all U -cocartesian morphisms of \mathcal{E} , and let R denote the collection of all morphisms f of \mathcal{E} such that $U(f)$ is an isomorphism in \mathcal{C} . We let

$$\text{Fun}(\mathcal{C} \times \Delta^1/\mathcal{C}, \mathcal{E}) = \mathcal{C} \times_{\text{Fun}(\Delta^1, \mathcal{C})} \text{Fun}(\Delta^1, \mathcal{E})$$

denote the relative exponential of Construction 4.5.9.1. Evaluation at the vertices $0, 1 \in \Delta^1$ determines evaluation functors $\text{ev}_0, \text{ev}_1 : \text{Fun}(\mathcal{C} \times \Delta^1/\mathcal{C}, \mathcal{E}) \rightarrow \mathcal{E}$. Let \tilde{L} denote the collection of all morphisms f of $\text{Fun}(\mathcal{C} \times \Delta^1/\mathcal{C}, \mathcal{E})$ such that $\text{ev}_0(f)$ is U -cocartesian, and let \tilde{R} denote the collection of all morphisms f of $\text{Fun}(\mathcal{C} \times \Delta^1/\mathcal{C}, \mathcal{E})$ such that $\text{ev}_1(f)$ is an isomorphism. The evaluation maps ev_0 and ev_1 then induce a functor

$$V : \text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1/\mathcal{C}, \mathcal{E})) \rightarrow \text{Cospan}^{L, R}(\mathcal{E}) \times_{\text{Cospan}^{\text{all, iso}}(\mathcal{C})} \text{Cospan}^{\text{all, iso}}(\mathcal{E}).$$

We will prove the following:

- 04EQ **Proposition 8.6.5.12.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let $V_- : \text{Cospan}^{L, R}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all, iso}}(\mathcal{C})$ be the cocartesian fibration of Lemma 8.6.5.8, and let $V_+ : \text{Cospan}^{\text{all, iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all, iso}}(\mathcal{C})$ be the cocartesian fibration of Remark 8.1.9.3. Then the functor*

$$V : \text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1/\mathcal{C}, \mathcal{E})) \rightarrow \text{Cospan}^{L, R}(\mathcal{E}) \times_{\text{Cospan}^{\text{all, iso}}(\mathcal{C})} \text{Cospan}^{\text{all, iso}}(\mathcal{E})$$

of Notation 8.6.5.11 is a left fibration, which exhibits V_- as a cocartesian dual of V_+ (in the sense of Definition 8.6.3.1).

Example 8.6.5.13. In the special case $\mathcal{C} = \Delta^0$, Proposition 8.6.5.12 reduces to the assertion 04ER that the map

$$\text{Cospan}^{\widetilde{L}, \widetilde{R}}(\text{Fun}(\Delta^1, \mathcal{E})) \rightarrow \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{E}) \times \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E})$$

is a balanced coupling of ∞ -categories, which is the content of Proposition 8.2.6.9.

Proof of Theorem 8.6.5.6 from Proposition 8.6.5.12. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets and let $U^\vee : \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}$ be the projection map; we wish to show that U^\vee is a cocartesian dual of U . Using Corollary 5.7.7.3, we can choose a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \mathcal{E}' \\ \downarrow U & & \downarrow U' \\ \mathcal{C} & \longrightarrow & \mathcal{C}', \end{array}$$

where U' is a cocartesian fibration of ∞ -categories. Using Remarks 8.6.3.4 and 8.6.5.4, we can replace U by U' and thereby reduce to the case where \mathcal{C} is an ∞ -category. In this case, we have commutative diagrams

$$\begin{array}{ccc} \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) & \longrightarrow & \text{Cospan}^{L, R}(\mathcal{E}) \\ \downarrow U^\vee & & \downarrow V_- \\ \mathcal{C} & \longrightarrow & \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}) \end{array} \quad \begin{array}{ccc} \mathcal{E} & \longrightarrow & \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E}) \\ \downarrow U & & \downarrow V_+ \\ \mathcal{C} & \longrightarrow & \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}), \end{array}$$

where the vertical maps are cocartesian fibrations, the diagram on the left is a pullback square, and the diagram on the right is a categorial pullback square (the horizontal maps are equivalences of ∞ -categories by virtue of Proposition 8.1.7.6). Using Remark 8.6.3.4 again, we are reduced to showing that V_- is a cocartesian dual of V_+ , which follows from Proposition 8.6.5.12. \square

We now turn to the proof of Proposition 8.6.5.12.

Lemma 8.6.5.14. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Then the 04ES functor*

$$V : \text{Cospan}^{\widetilde{L}, \widetilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})) \rightarrow \text{Cospan}^{L, R}(\mathcal{E}) \times_{\text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})} \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E})$$

of Notation 8.6.5.11 is a left fibration.

Proof. Let $\pi : \mathcal{E} \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}$ denote the functor given by projection onto the second factor. Let L' denote the collection of all π -cocartesian morphisms of $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}$: that is, morphisms (u, v) where u is a U -cocartesian morphism in \mathcal{E} . Let R' denote the collection of all morphisms (u, v) of $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}$ where v is an isomorphism in \mathcal{E} . It follows from Proposition 8.1.9.10 (and Example 8.1.6.6) that the pair (L', R') is pushout-compatible, in the sense of Definition 8.1.6.5. Moreover, we have a canonical isomorphism of simplicial sets

$$\text{Cospan}^{L', R'}(\mathcal{E} \times_{\mathcal{C}} \mathcal{E}) \simeq \text{Cospan}^{L, R}(\mathcal{E}) \times_{\text{Cospan}^{\text{all,iso}}(\mathcal{C})} \text{Cospan}^{\text{all,iso}}(\mathcal{E}).$$

Using Lemma 8.6.5.8, we see that π induces a cocartesian fibration $\text{Cospan}^{L', R'}(\mathcal{E} \times_{\mathcal{C}} \mathcal{E}) \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{E})$, where the target is an ∞ -category (Proposition 8.1.7.5). It follows that the simplicial set $\text{Cospan}^{L', R'}(\mathcal{E} \times_{\mathcal{C}} \mathcal{E})$ is also an ∞ -category.

Let $\text{ev}_0, \text{ev}_1 : \text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E}) \rightarrow \mathcal{E}$ denote functors given by evaluation at $0, 1 \in \Delta^1$, so that ev_0 and ev_1 determine a functor

$$\text{ev} : \text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E}) \rightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{E}.$$

By construction we have $\tilde{L} = \text{ev}^{-1}(L')$ and $\tilde{R} = \text{ev}^{-1}(R')$. Note that ev is a pullback of the map $\text{Fun}(\Delta^1, \mathcal{E}) = \mathcal{E} \tilde{\times}_{\mathcal{E}} \mathcal{E} \rightarrow \mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{E}$. Moreover, we can identify V with the map

$$\text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})) \rightarrow \text{Cospan}^{L', R'}(\mathcal{E} \times_{\mathcal{C}} \mathcal{E})$$

induced by ev . By virtue of Example 8.1.10.13, to show that V is a left fibration, it will suffice to verify the following:

- (0) Every element of \tilde{L} is ev -cocartesian, and every element of \tilde{R} is ev -cartesian. This follows from Lemma 5.3.7.1.
- (1) Fix an object $C \in \mathcal{C}$ and a morphism $f : X \rightarrow Y$ in the ∞ -category \mathcal{E}_C , which we identify with an object of the ∞ -category $\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})$. Let $(u, v) : (X', Y') \rightarrow (X, Y)$ be a morphism of $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}$ which belongs to R' (so that v is an isomorphism in \mathcal{E}). Then we can write $(u, v) = \text{ev}(w)$ for some morphism $w : f' \rightarrow f$ in the ∞ -category $\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})$ (the morphism w then belongs to \tilde{R} and is therefore automatically ev -cartesian). To prove this, we note that $U(u) = U(v)$ determines an edge $\Delta^1 \rightarrow \mathcal{C}$. Replacing \mathcal{E} by the fiber product $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$, we can reduce to the situation where $\mathcal{C} = \Delta^1$ is a standard simplex. In this case, we are reduced to the problem of constructing a diagram $\Delta^1 \times \Delta^1 \rightarrow \mathcal{E}$ whose boundary is indicated in the simplex

$$\begin{array}{ccc} X' & \overset{f'}{\dashrightarrow} & Y' \\ \downarrow u & & \downarrow v \\ X & \xrightarrow{f} & Y \end{array}$$

which is possible by virtue of our assumption that v is an isomorphism.

- (2) Fix an object $C \in \mathcal{C}$ and a morphism $f : X \rightarrow Y$ as above, and let $(u, v) : (X, Y) \rightarrow (X', Y')$ be a morphism of $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}$ which belongs to L' (so that u is a U -cocartesian morphism of \mathcal{E}). Then we can write $(u, v) = \text{ev}(w)$, for some morphism $w : f \rightarrow f'$ in the ∞ -category $\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})$ (the morphism w then belongs to \tilde{L} and is therefore automatically ev -cocartesian). This follows from Proposition 5.3.7.2 (or by a direct argument similar to the proof of (1)).

□

Proof of Proposition 8.6.5.12. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, and let

$$V : \text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})) \rightarrow \text{Cospan}^{L, R}(\mathcal{E}) \times_{\text{Cospan}^{\text{all,iso}}(\mathcal{C})} \text{Cospan}^{\text{all,iso}}(\mathcal{E})$$

be the left fibration of Lemma 8.6.5.14. We wish to show that the left fibraiton V exhibits $V_- : \text{Cospan}^{L, R}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$ as a cocartesian dual of $V_+ : \text{Cospan}^{\text{all,iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$. For each object $C \in \mathcal{C}$, let $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ denote the corresponding fiber of U . Then we have a canonical isomorphism

$$\{C\} \times_{\text{Cospan}^{\text{all,iso}}(\mathcal{C})} \text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E})) \simeq \text{Cospan}^{\tilde{L}_C, \tilde{R}_C}(\text{Fun}(\Delta^1, \mathcal{E}_C)),$$

where \tilde{L}_C denotes the collection of all morphisms of $\text{Fun}(\Delta^1, \mathcal{E}_C)$ for which the image in $\text{Fun}(\{0\}, \mathcal{E}_C)$ is an isomorphism, and \tilde{R}_C denotes the collection of morphisms $\text{Fun}(\Delta^1, \mathcal{E}_C)$ for which the image in $\text{Fun}(\{1\}, \mathcal{E}_C)$ is an isomorphism. The left fibration V then restricts to a coupling of ∞ -categories

$$V_C : \text{Cospan}^{\tilde{L}_C, \tilde{R}_C}(\mathcal{E}_C) \rightarrow \text{Cospan}^{\text{iso,all}}(\mathcal{E}_C) \times \text{Cospan}^{\text{all,iso}}(\mathcal{E}_C)$$

which is balanced by virtue of Proposition 8.2.6.9. Moreover, if f is an object of the ∞ -category $\text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E}))$ satisfying $V(f) = C$, then f is universal (with respect to the coupling V_C) if and only if it is an isomorphism when regarded as a morphism in the ∞ -category \mathcal{E}_C (Corollary 8.2.6.14).

Let $u : f \rightarrow g$ be a morphism in the ∞ -category $\text{Cospan}^{\tilde{L}, \tilde{R}}(\text{Fun}(\mathcal{C} \times \Delta^1 / \mathcal{C}, \mathcal{E}))$, having image $\bar{u} : C \rightarrow D$ in the ∞ -category $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$. Assume that the image of u in $\text{Cospan}^{L, R}(\mathcal{E})$ is V_- -cocartesian and that the image of u in $\text{Cospan}^{\text{all,iso}}(\mathcal{E})$ is V_+ -cocartesian. To complete the proof, we must show that if f is an isomorphism in the ∞ -category \mathcal{E}_C , then g is an isomorphism in the ∞ -category \mathcal{E}_D . To prove this, let us identify u with a

commutative diagram

$$\begin{array}{ccccc}
 X_- & \xrightarrow{s_-} & B_- & \xleftarrow{t_-} & Y_- \\
 \downarrow f & & \downarrow h & & \downarrow g \\
 X_+ & \xrightarrow{s_+} & B_+ & \xleftarrow{t_+} & Y_+
 \end{array}$$

in the ∞ -category \mathcal{E} , where s_- is U -cocartesian and t_+ is an isomorphism. Since the image of u in $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{E})$ is V_+ -cocartesian, the morphism s_+ is U -cocartesian. Applying Corollary 5.1.2.4, we deduce that the morphism h is U -cocartesian. Since the image of u in $\text{Cospan}^{L,R}(\mathcal{E})$ is V_- -cocartesian, the morphism t_- is an isomorphism. Applying Corollary 5.1.2.5, we deduce that g is U -cocartesian when regarded as a morphism of \mathcal{E} , and is therefore an isomorphism in the ∞ -category \mathcal{E}_D (Example 5.1.3.6). \square

8.6.6 Comparison of Dual and Conjugate Fibrations

04ET In this section, we show that the theory of conjugate fibrations (introduced in §8.6.1) can be regarded as a reformulation of cocartesian duality (introduced in §8.6.3). Our main result can be stated as follows:

04EU **Proposition 8.6.6.1.** *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Then U^\dagger is a cartesian conjugate of U (in the sense of Definition 8.6.1.1) if and only if the opposite fibration $U^{\dagger,\text{op}} : \mathcal{E}^{\dagger,\text{op}} \rightarrow \mathcal{C}$ is a cocartesian dual of U (in the sense of Definition 8.6.3.1).*

04EV **Corollary 8.6.6.2.** *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Then U^\dagger is a cartesian conjugate of U if and only if U^{op} is a cartesian conjugate of $U^{\dagger,\text{op}}$.*

Proof. Combine Proposition 8.6.6.1 with Remark 8.6.3.3. \square

04EW **Corollary 8.6.6.3.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration of ∞ -categories, and suppose we are given a commutative diagram*

$$\begin{array}{ccc}
 \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\
 \downarrow & & \downarrow U \\
 \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C}.
 \end{array}$$

The following conditions are equivalent:

- (1) *The functor T exhibits U^\dagger as a cartesian conjugate of U (in the sense of Definition 8.6.1.1).*
- (2) *The functor T exhibits \mathcal{E} as a localization of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with respect to W , where W is the collection of all morphisms $w = (w', w'')$ where w' is a U' -cartesian morphism of \mathcal{E}^\dagger and w'' is a morphism of $\text{Tw}(\mathcal{C})$ whose image in \mathcal{C} is degenerate.*

Proof. We will show that (2) implies (1); the reverse implication follows from Proposition 8.6.2.11. Using Corollary 8.6.6.2 and Corollary 8.6.2.4, we can choose a cocartesian fibration $U' : \mathcal{E}' \rightarrow \mathcal{C}$ and a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T'} & \mathcal{E}' \\ \downarrow & & \downarrow U' \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array}$$

which exhibits U^\dagger as a cartesian conjugate of U' . Assume that condition (2) is satisfied, so that we have a commutative diagram

$$\begin{array}{ccc} \text{Fun}(\mathcal{E}, \mathcal{E}') & \xrightarrow{T^\circ} & \text{Fun}((\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}))[W^{-1}], \mathcal{E}') \\ \downarrow U_\circ & & \downarrow U'_\circ \\ \text{Fun}(\mathcal{E}, \mathcal{C}) & \xrightarrow{T^\circ} & \text{Fun}((\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}))[W^{-1}], \mathcal{C}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories and the vertical maps are isofibrations (Corollary 4.4.5.6). Applying Corollary 4.5.2.27, we deduce that the map

$$(\circ T) : \text{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}') \rightarrow \text{Fun}_{/\mathcal{C}}(\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}), \mathcal{E}')$$

is fully faithful, and that its essential image consists of those functors $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}'$ which carry each morphism of W to an isomorphism in \mathcal{E}' . We may therefore assume without loss of generality that $T' = F \circ T$ for some functor $F \in \text{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$. Proposition 8.6.2.11 implies that T' exhibits \mathcal{E}' as a localization of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with respect to W . It follows that F is an equivalence of ∞ -categories (Remark 6.3.1.19), so that T also exhibits U^\dagger as a cartesian conjugate of U . \square

Our proof of Proposition 8.6.6.1 will require some preliminaries.

04EX Construction 8.6.6.4. Let \mathcal{C} be a simplicial set, and suppose we are given a pair of morphisms $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$. Let $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ be a morphism of simplicial sets for which the diagram

$$\begin{array}{ccc} 04\text{EY} & \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} \mathcal{E} \\ & \downarrow & \downarrow U \\ & \text{Tw}(\mathcal{C}) & \xrightarrow{} \mathcal{C} \end{array} \quad (8.63)$$

is commutative. Let $\lambda_+ : \text{Tw}(\mathcal{E}^\dagger) \rightarrow \mathcal{E}^\dagger$ be the projection map of Notation 8.1.1.6 and let $\iota : \text{Tw}(\mathcal{C}^{\text{op}}) \xrightarrow{\sim} \text{Tw}(\mathcal{C})$ be the isomorphism described in Remark 8.1.1.7. Then we can extend (8.63) to a commutative diagram

$$\begin{array}{ccccc} 04\text{EZ} & \text{Tw}(\mathcal{E}^\dagger) & \xrightarrow{(\lambda_+, \iota \circ \text{Tw}(U^\dagger))} & \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} \mathcal{E} \\ & \downarrow \text{Tw}(U^\dagger) & & \downarrow & \downarrow U \\ & \text{Tw}(\mathcal{C}^{\text{op}}) & \xrightarrow{\iota} & \text{Tw}(\mathcal{C}) & \xrightarrow{} \mathcal{C}. \end{array} \quad (8.64)$$

Using Proposition 8.1.3.7, we can identify the outer rectangle with a diagram

$$\begin{array}{ccc} 04\text{F0} & \mathcal{E}^\dagger & \longrightarrow \text{Cospan}(\mathcal{E}) \\ & \downarrow U^\dagger & \downarrow \text{Cospan}(U) \\ & \mathcal{C}^{\text{op}} & \longrightarrow \text{Cospan}(\mathcal{C}), \end{array} \quad (8.65)$$

where the lower horizontal map is the monomorphism of Variant 8.1.7.14. Passing to opposite simplicial sets (and invoking Remark 8.1.3.4), we obtain a comparison map

$$\Psi : \mathcal{E}^{\dagger, \text{op}} \rightarrow \mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}(\mathcal{E}) = \text{Cospan}(\mathcal{E} / \mathcal{C}),$$

where $\text{Cospan}(\mathcal{E} / \mathcal{C})$ is the simplicial set defined in Notation 8.6.5.1.

04F1 Remark 8.6.6.5. In the situation of Construction 8.6.6.4, the comparison map

$$\Psi : \mathcal{E}^{\dagger, \text{op}} \rightarrow \text{Cospan}(\mathcal{E} / \mathcal{C}) \subseteq \text{Cospan}(\mathcal{E})$$

can be described explicitly on low-dimensional simplices as follows:

- If X is a vertex of \mathcal{E}^\dagger having image $C = U^\dagger(X)$, then $\Psi(X)$ is the vertex of $\text{Cospan}(\mathcal{E})$ corresponding to the vertex $T(X, \text{id}_C) \in \mathcal{E}$.
- Let X and Y be vertices of \mathcal{E}^\dagger , having images $C = U^\dagger(X)$ and $D = U^\dagger(Y)$. Let $f : Y \rightarrow X$ be an edge of \mathcal{E}^\dagger , and let us identify $U^\dagger(f)$ with an edge $e : C \rightarrow D$ in the simplicial set \mathcal{C} . Then $\Psi(f) : \Psi(X) \rightarrow \Psi(Y)$ is the edge of $\text{Cospan}(\mathcal{E} / \mathcal{C})$ corresponding to the pair of edges $T(X, \text{id}_C) \xrightarrow{T(\text{id}_X, e_L)} T(X, e) \xleftarrow{T(f, e_R)} T(Y, \text{id}_D)$ in \mathcal{E} ; here $e_L : \text{id}_C \rightarrow e$ and $e_R : \text{id}_D \rightarrow e$ denote the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6.

We will deduce Proposition 8.6.6.1 from the following more precise result:

Proposition 8.6.6.6. *Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, 04F2 and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Suppose we are given a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ for which the diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array}$$

is commutative. The following conditions are equivalent:

- The morphism T exhibits U^\dagger as a cartesian conjugate of U_+ , in the sense of Definition 8.6.1.1.*
- The comparison map $\Psi : \mathcal{E}^{\dagger, \text{op}} \rightarrow \text{Cospan}(\mathcal{E} / \mathcal{C})$ of Construction 8.6.6.4 factors through the simplicial subset $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})$ of Notation 8.6.5.1. Moreover, Ψ is an equivalence of cocartesian fibrations over \mathcal{C} .*

Proof. Using Proposition 5.1.7.14, we see that (b) is equivalent to the following three conditions:

- (b₀) The map Ψ factors through the simplicial subset $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) \subseteq \text{Cospan}(\mathcal{E} / \mathcal{C})$.
- (b₁) Let $U^\vee : \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}$ be the cocartesian fibration of Lemma 8.6.5.10. Then Ψ carries U^\dagger -cartesian edges of \mathcal{E}^\dagger to U^\vee -cocartesian edges of $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})$.
- (b₂) For each vertex $C \in \mathcal{C}$, the morphism Ψ restricts to an equivalence of ∞ -categories

$$\Psi_C : (\mathcal{E}_C^\dagger)^{\text{op}} \rightarrow \{C\} \times_{\mathcal{C}} \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C}) = \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{E}_C).$$

For every edge $e : C \rightarrow D$ of \mathcal{C} , let $e_L : \text{id}_C \rightarrow e$ and $e_R : \text{id}_D \rightarrow e$ denote the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6. Using Remark 8.6.6.5, we can rewrite condition (b_0) as follows:

- (b'_0) Let X be a vertex of \mathcal{E}^\dagger having image $C = U^\dagger(X)$ in \mathcal{C} , and let $e : C \rightarrow D$ be an edge of \mathcal{C} . Then $T(\text{id}_X, e_L) : T(X, \text{id}_C) \rightarrow T(X, e)$ is a U -cocartesian edge of \mathcal{E} .

Similarly, by combining Remark 8.6.6.5 with the characterization of U^\vee -cartesian edges supplied by Lemma 8.6.5.10, we can rewrite condition (b_1) as follows:

- (b'_1) Let $f : Y \rightarrow X$ be a U^\dagger -cartesian edge of \mathcal{E}^\dagger , and let us identify $U^\dagger(f)$ with an edge $e : C \rightarrow D$ of \mathcal{C} . Then $T(f, e_R) : T(Y, \text{id}_D) \rightarrow T(X, e)$ is an isomorphism in the ∞ -category \mathcal{E}_C .

Unwinding the definitions, we observe that for each vertex $C \in \mathcal{C}$, the functor Ψ_C factors as a composition

$$(\mathcal{E}_C^\dagger)^{\text{op}} \xrightarrow{T_C^{\text{op}}} \mathcal{E}_C^{\text{op}} \hookrightarrow \text{Cospan}^{\text{iso},\text{all}}(\mathcal{E}_C),$$

where the second map is the equivalence of Variant 8.1.7.14. We can therefore rewrite (b_2) as follows:

- (b'_2) For each vertex $C \in \mathcal{C}$, the morphism T restricts to an equivalence of ∞ -categories $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$.

The equivalence of (a) and (b) now follows from Proposition 8.6.1.13. \square

04F3 **Corollary 8.6.6.7.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian conjugate of U .*

Proof. Using Corollary 8.6.2.4, we can choose a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits U^\dagger as a cartesian conjugate of U . Applying Proposition 8.6.6.6, we see that the comparison map of Construction 8.6.6.4 provides a morphism $\mathcal{E}^\dagger \rightarrow \text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})^{\text{op}}$ which is an equivalence of cartesian fibrations over \mathcal{C}^{op} . It follows that the projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is also a cartesian conjugate of U . \square

04F4 **Corollary 8.6.6.8 (Uniqueness).** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then U admits a cartesian conjugate, which is uniquely determined up equivalence.*

Proof. Combining Proposition 8.6.6.6 with Corollary 8.6.6.7, we see that a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is conjugate to U if and only if it is equivalent to the projection map $\text{Cospan}^{\text{CCart}}(\mathcal{E} / \mathcal{C})^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$. \square

Example 8.6.6.9. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Applying 04F5 Construction 8.6.6.4 to the evaluation functor

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E} \quad (C, f_C, u : C \rightarrow C') \mapsto f_C(u),$$

we obtain a comparison map

$$\Psi : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})^{\mathrm{op}} \rightarrow \mathrm{Cospan}^{\mathrm{CCart}}(\mathcal{E} / \mathcal{C})$$

which is an equivalence of ∞ -categories (Proposition 8.6.6.6).

Warning 8.6.6.10. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Corollary 04F6 8.6.6.7 guarantees that existence of a morphism $T : \mathrm{Cospan}^{\mathrm{CCart}}(\mathcal{E} / \mathcal{C})^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits the projection map $\mathrm{Cospan}^{\mathrm{CCart}}(\mathcal{E} / \mathcal{C})^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ as a cartesian conjugate of U . Beware that the construction of T requires making some auxiliary choices. For example, if \mathcal{C} is an ∞ -category, then we can construct the datum T by choosing a homotopy inverse to the equivalence $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E})^{\mathrm{op}} \rightarrow \mathrm{Cospan}^{\mathrm{CCart}}(\mathcal{E} / \mathcal{C})$ of Example 8.6.6.9.

Proof of Proposition 8.6.6.1. Let \mathcal{C} be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration. Let $U^\vee : \mathrm{Cospan}^{\mathrm{CCart}}(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}$ be the projection map. Then U^\vee is a cocartesian dual of U (Theorem 8.6.5.6), and the opposite fibration $U^{\vee, \mathrm{op}}$ is a cartesian conjugate of U (Corollary 8.6.6.7). Let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration of simplicial sets. Using the uniqueness assertions of Theorem 8.6.4.1 and Corollary 8.6.6.8, we see that the following conditions are equivalent:

- The fibration U^\dagger is a cartesian conjugate of U .
- The fibration U^\dagger is equivalent to $U^{\vee, \mathrm{op}}$ (as a cartesian fibration over $\mathcal{C}^{\mathrm{op}}$).
- The fibration $U^{\dagger, \mathrm{op}}$ is equivalent to U^\vee (as a cocartesian fibration over \mathcal{C}).
- The fibration $U^{\dagger, \mathrm{op}}$ is a cocartesian dual of U .

□

Remark 8.6.6.11. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let 04F7 $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ be the opposite fibration. By virtue of Theorem 8.6.4.1 and Corollary 8.6.6.8, U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ and a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\mathrm{op}}$, which are uniquely determined up to equivalence and opposite to one another (Proposition 8.6.6.1). When \mathcal{C} is an ∞ -category, all four of these fibrations can be realized as a suitable restriction of the projection map $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{E}) \rightarrow \mathrm{Cospan}(\mathcal{C})$. Let L denote the collection of all U -cocartesian morphisms of \mathcal{E} , and let R denote the collection of all morphisms f of \mathcal{E} such that $U(f)$ is an isomorphism in \mathcal{C} . Then:

- Using Proposition 8.1.7.6, we can identify U with the map

$$\text{Cospan}^{\text{all}, L \cap R}(\mathcal{E}) = \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}).$$

- Using Variant 8.1.7.14, we can identify U^{op} with the map

$$\text{Cospan}^{L \cap R, \text{all}}(\mathcal{E}) = \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C}).$$

- Using Theorem 8.6.5.6 (and Remark 8.6.5.9), we can identify U^{\vee} with the map $\text{Cospan}^{L, R}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$.
- Using Proposition 8.6.6.6 (and Remark 8.6.5.9), we can identify U^{\dagger} with the map $\text{Cospan}^{R, L}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C})$.

8.6.7 The Opposition Functor

04F8 Recall that, for every ∞ -category \mathcal{C} , the opposite simplicial set \mathcal{C}^{op} is also an ∞ -category (Proposition 1.3.2.6). Our goal in this section is to show that the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$ can be promoted to a functor of ∞ -categories $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$, where \mathcal{QC} denotes the ∞ -category of (small) ∞ -categories (Construction 5.6.4.1). Beware that this is not completely obvious from the definition. The ∞ -category \mathcal{QC} was obtained as the homotopy coherent nerve $N_{\bullet}^{\text{hc}}(\text{QCat})$, where QCat denotes the simplicial category whose objects are ∞ -categories and whose morphism spaces are given by the formula $\text{Hom}_{\text{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \text{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$. The construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$ determines an automorphism of QCat as an ordinary category. However, this automorphism is *not* compatible with the simplicial enrichment of QCat : for ∞ -categories \mathcal{C} and \mathcal{D} , the Kan complex $\text{Hom}_{\text{QCat}}(\mathcal{C}^{\text{op}}, \mathcal{D}^{\text{op}})_{\bullet} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{D}^{\text{op}})^{\simeq}$ identifies with the *opposite* of the Kan complex $\text{Hom}_{\text{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \text{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$. To address this point, it is convenient to work with a slight variant of Construction 5.6.4.1.

04F9 **Notation 8.6.7.1.** Let \mathcal{E} be a simplicial category. We define a new simplicial category \mathcal{E}^{\simeq} as follows:

- The objects of \mathcal{E}^{\simeq} are the objects of \mathcal{E} .
- For every pair of objects $X, Y \in \mathcal{E}$, the simplicial set $\text{Hom}_{\mathcal{E}^{\simeq}}(X, Y)_{\bullet}$ is the twisted arrow construction $\text{Tw}(\text{Hom}_{\mathcal{E}}(X, Y)_{\bullet})$.
- For every triple of objects $X, Y, Z \in \mathcal{E}$, the composition law

$$\circ : \text{Hom}_{\mathcal{E}^{\simeq}}(Y, Z)_{\bullet} \times \text{Hom}_{\mathcal{E}^{\simeq}}(X, Y)_{\bullet} \rightarrow \text{Hom}_{\mathcal{E}^{\simeq}}(X, Z)_{\bullet}$$

is obtained by applying the twisted arrow functor Tw to the composition law for the simplicial category \mathcal{E} .

The simplicial category \mathcal{E}^\simeq is equipped with a simplicial functor $\pi : \mathcal{E}^\simeq \rightarrow \mathcal{E}$, which carries each object to itself and is given on morphism spaces by the projection map

$$\mathrm{Hom}_{\mathcal{E}^\simeq}(X, Y)_\bullet = \mathrm{Tw}(\mathrm{Hom}_{\mathcal{E}}(X, Y)_\bullet) \rightarrow \mathrm{Hom}_{\mathcal{E}}(X, Y)_\bullet$$

described in Notation 8.1.1.6.

Proposition 8.6.7.2. *Let \mathcal{E} be a locally Kan simplicial category. Then:*

04FA

- (1) *The simplicial category \mathcal{E}^\simeq of Notation 8.6.7.1 is locally Kan.*
- (2) *The forgetful functor $\pi : \mathcal{E}^\simeq \rightarrow \mathcal{E}$ is a weak equivalence of simplicial categories (see Definition 4.6.7.7).*
- (3) *The functor π induces an equivalence of ∞ -categories $N_\bullet^{\mathrm{hc}}(\mathcal{E}^\simeq) \xrightarrow{\sim} N_\bullet^{\mathrm{hc}}(\mathcal{E})$.*

Proof. Assertions (1) and (2) follow immediately from Corollary 8.1.2.3; assertion (3) then follows from Corollary 4.6.7.8. \square

Remark 8.6.7.3 (Comparison with the Conjugate). Let \mathcal{E} be a simplicial category. Recall 04FB that the *conjugate* \mathcal{E}^c is a simplicial category having the same objects, with morphism spaces given by $\mathrm{Hom}_{\mathcal{E}^c}(X, Y)_\bullet = \mathrm{Hom}_{\mathcal{E}}(X, Y)_\bullet^{\mathrm{op}}$ (see Example 2.4.2.12). Then there is a canonical isomorphism of simplicial categories $\mathcal{E}^\simeq \xrightarrow{\sim} (\mathcal{E}^c)^\simeq$, which is the identity on objects and given on morphism spaces by the isomorphisms

$$\mathrm{Hom}_{\mathcal{E}^\simeq}(X, Y)_\bullet = \mathrm{Tw}(\mathrm{Hom}_{\mathcal{E}}(X, Y)_\bullet) \simeq \mathrm{Tw}(\mathrm{Hom}_{\mathcal{E}}(X, Y)_\bullet^{\mathrm{op}}) = \mathrm{Hom}_{(\mathcal{E}^c)^\simeq}(X, Y)_\bullet$$

described in Remark 8.1.1.7. Composing this isomorphism with the forgetful functor $(\mathcal{E}^c)^\simeq \rightarrow \mathcal{E}^c$, we obtain a forgetful functor $\pi^c : \mathcal{E}^\simeq \rightarrow \mathcal{E}^c$. If \mathcal{E} is locally Kan, then Proposition 8.6.7.2 guarantees that π^c is a weak equivalence of simplicial categories. We therefore obtain equivalences of ∞ -categories

$$N_\bullet^{\mathrm{hc}}(\mathcal{E}) \xleftarrow{\sim} N_\bullet^{\mathrm{hc}}(\mathcal{E}^\simeq) \xrightarrow{\sim} N_\bullet^{\mathrm{hc}}(\mathcal{E}^c).$$

We now specialize to the case of interest to us.

Construction 8.6.7.4. Let QCat denote the simplicial category whose objects are (small) ∞ -categories, with morphism spaces given by $\mathrm{Hom}_{\mathrm{QCat}}(\mathcal{C}, \mathcal{D})_\bullet = \mathrm{Fun}(\mathcal{C}, \mathcal{D})^\simeq$ (see Construction 5.6.4.1). We let QCat^\simeq denote the simplicial category described in Notation 8.6.7.1, and we let \mathcal{QC}^\simeq denote the homotopy coherent nerve $N_\bullet^{\mathrm{hc}}(\mathrm{QCat}^\simeq)$.

Proposition 8.6.7.5. *The simplicial set \mathcal{QC}^\simeq is an ∞ -category. Moreover, the forgetful functor $\mathrm{QCat}^\simeq \rightarrow \mathrm{QCat}$ of Notation 8.6.7.1 induces an equivalence of ∞ -categories $\pi : \mathcal{QC}^\simeq \rightarrow \mathcal{QC}$.*

04FD

Proof. Apply Proposition 8.6.7.2 to the locally Kan simplicial category $\mathcal{E} = \text{QCat}$. \square

04FE **Construction 8.6.7.6** (The Opposite Functor). The simplicial category QCat^\simeq is equipped with an automorphism $\tilde{\sigma}$, given on objects by the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$ and on morphism spaces by the composition

$$\begin{aligned}\text{Hom}_{\text{QCat}^\simeq}(\mathcal{C}, \mathcal{D})_\bullet &= \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})^\simeq) \\ &\simeq \text{Tw}((\text{Fun}(\mathcal{C}, \mathcal{D})^\simeq)^{\text{op}}) \\ &\simeq \text{Tw}(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{D}^{\text{op}})^\simeq) \\ &= \text{Hom}_{\text{QCat}^\simeq}(\mathcal{C}^{\text{op}}, \mathcal{D}^{\text{op}}),\end{aligned}$$

where the isomorphism on the second line is supplied by Remark 8.1.1.7. It follows from Proposition 8.6.7.5 that there exists a functor of ∞ -categories $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ for which the diagram

$$\begin{array}{ccc}\mathcal{QC}^\simeq & \xrightarrow[\sim]{N_\bullet^{\text{hc}}(\tilde{\sigma})} & \mathcal{QC}^\simeq \\ \pi \downarrow & & \downarrow \pi \\ \mathcal{QC} & \xrightarrow{\sigma} & \mathcal{QC}\end{array}$$

commutes up to isomorphism. Moreover, the functor σ is uniquely determined up to isomorphism. We will refer to σ as the *opposition functor* for the ∞ -category \mathcal{QC} .

The terminology of Construction 8.6.7.6 is justified by the following observation:

04FF **Proposition 8.6.7.7.** *Let $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Then the diagram of ∞ -categories*

$$\begin{array}{ccc}N_\bullet(\text{QCat}) & \xrightarrow{\sigma_0} & N_\bullet(\text{QCat}) \\ \downarrow & & \downarrow \\ \mathcal{QC} & \xrightarrow{\sigma} & \mathcal{QC}\end{array}$$

commutes up to isomorphism, where the functor σ_0 is given by the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$.

Proof. Let QCat° denote the underlying category of the simplicial category QCat , and let us abuse notation by viewing QCat° as a *constant* simplicial category. We can then identify QCat° with a simplicial subcategory of QCat having the same objects, with morphism spaces given by

$$\text{Hom}_{\text{QCat}^\circ}(\mathcal{C}, \mathcal{D})_\bullet = \text{sk}_0(\text{Hom}_{\text{QCat}}(\mathcal{C}, \mathcal{D})_\bullet).$$

Note that the inclusion map $\text{QCat}^\circ \hookrightarrow \text{QCat}$ factors as a composition

$$\text{QCat}^\circ \xrightarrow{\iota} \text{QCat}^\simeq \xrightarrow{\pi} \text{QCat},$$

where the functor $\iota : \text{QCat}^\circ \rightarrow \text{QCat}^\simeq$ carries each ∞ -category \mathcal{C} to itself and each functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ to the vertex

$$\text{id}_F \in \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})^\simeq) = \text{Hom}_{\text{QCat}^\simeq}(\mathcal{C}, \mathcal{D})_\bullet.$$

We then have a diagram of ∞ -categories

$$\begin{array}{ccc} N_\bullet(\text{QCat}) & \xrightarrow{\sigma_0} & N_\bullet(\text{QCat}) \\ \downarrow N_\bullet^{\text{hc}}(\iota) & & \downarrow N_\bullet^{\text{hc}}(\iota) \\ \mathcal{QC}^\simeq & \xrightarrow{N_\bullet^{\text{hc}}(\tilde{\sigma})} & \mathcal{QC}^\simeq \\ \downarrow & & \downarrow \\ \mathcal{QC} & \xrightarrow{\sigma} & \mathcal{QC}, \end{array}$$

where the upper square is strictly commutative and the lower square commutes up to isomorphism. It follows that the outer rectangle also commutes up to isomorphism. \square

Remark 8.6.7.8. Let $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. 04FG Passing to homotopy categories, we obtain a functor $\bar{\sigma} : \text{hQCat} \rightarrow \text{hQCat}$. It follows from Proposition 8.6.7.7 that, up to isomorphism, $\bar{\sigma}$ agrees with the automorphism of hQCat which is given on objects by the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$, and on morphisms by the construction $[F] \mapsto [F^{\text{op}}]$; here $[F]$ denotes the isomorphism class of a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ and $[F^{\text{op}}]$ the isomorphism class of the opposition functor $F^{\text{op}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{D}^{\text{op}}$.

Proposition 8.6.7.9 (Involutivity). *Let $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ be the opposition functor. Then 04FH the composition $\sigma \circ \sigma$ is isomorphic to the identity functor $\text{id}_{\mathcal{QC}}$. In particular, σ is an equivalence of ∞ -categories.*

Proof. This follows from Proposition 8.6.7.5, since the composition $\tilde{\sigma} \circ \tilde{\sigma}$ is equal to the identity functor of the ∞ -category \mathcal{QC}^\simeq . \square

Remark 8.6.7.10 (Uniqueness). Let $\text{Aut}(\mathcal{QC})$ denote the full subcategory of $\text{Fun}(\mathcal{QC}, \mathcal{QC})$ 04FJ spanned by those functors $\mathcal{QC} \rightarrow \mathcal{QC}$ which are equivalences of ∞ -categories. A theorem of Toën ([55]) guarantees that $\text{Aut}(\mathcal{QC})$ is a Kan complex having exactly two connected

components, each of which is contractible (see Corollary [?]). Consequently, the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ of Construction 8.6.7.4 is characterized (up to a contractible space of choices) by the fact that it is an equivalence of ∞ -categories which is not isomorphic to the identity functor $\text{id}_{\mathcal{QC}}$.

Recall that every Kan complex X is homotopy equivalent to its opposite X^{op} (Example 8.6.3.18). The following is a more precise statement:

04FK **Proposition 8.6.7.11.** *Let $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Then the restriction $\sigma|_{\mathcal{S}}$ is isomorphic to the identity functor from $\mathcal{S} \subset \mathcal{QC}$ to itself.*

Proof. For every ∞ -category \mathcal{C} , the image $\sigma(\mathcal{C}) \in \mathcal{QC}$ is equivalent to the opposite ∞ -category \mathcal{C}^{op} (Remark 8.6.7.8); in particular, \mathcal{C} is a Kan complex if and only if $\sigma(\mathcal{C})$ is a Kan complex. It follows that σ restrict a functor $\sigma_0 : \mathcal{S} \rightarrow \mathcal{S}$, which is also an equivalence of ∞ -categories. We wish to show that σ_0 is isomorphic to the identity functor $\text{id}_{\mathcal{S}}$. This follows from Example 8.4.0.4, since $\sigma_0(\Delta^0)$ is homotopy equivalent to the Kan complex $(\Delta^0)^{\text{op}} \simeq \Delta^0$. \square

Using the classification of cocartesian fibrations given in §5.7, we can use the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ to give a reformulation of cocartesian duality.

04FL **Proposition 8.6.7.12.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^{\vee} : \mathcal{E}^{\vee} \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having transport representations $\text{Tr}_{\mathcal{E}/\mathcal{C}}, \text{Tr}_{\mathcal{E}^{\vee}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}$. Then U^{\vee} is a cocartesian dual of U if and only if $\text{Tr}_{\mathcal{E}^{\vee}/\mathcal{C}}$ is isomorphic to $\sigma \circ \text{Tr}_{\mathcal{E}/\mathcal{C}}$, where $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ denotes the opposition functor of Construction 8.6.7.6.*

Proof. Assume that $\text{Tr}_{\mathcal{E}^{\vee}/\mathcal{C}}$ is isomorphic to $\sigma \circ \text{Tr}_{\mathcal{E}/\mathcal{C}}$; we will show that U^{\vee} is cocartesian dual to U (the reverse implication then follows formally from the fact that cocartesian duals are unique up to equivalence; see Theorem 8.6.4.1). Let $\pi : \text{QCat}^{\prec} \rightarrow \text{QCat}$ denote the forgetful functor, and let $\pi' : \text{QCat}^{\prec} \rightarrow \text{QCat}$ be the composition of π with the automorphism $\tilde{\sigma} : \text{QCat}^{\prec} \simeq \text{QCat}^{\prec}$ described in Construction 8.6.7.6. By virtue of Proposition 8.6.7.5, we may assume without loss of generality that the covariant transport representation $\mathcal{F}_+ = \text{Tr}_{\mathcal{E}/\mathcal{C}}$ factors as a composition $N_{\bullet}^{\text{hc}}(\pi) \circ \mathcal{F}$ for some diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}^{\prec}$. Set $\mathcal{F}_- = N_{\bullet}^{\text{hc}}(\pi') \circ \mathcal{F}$. Our assumption then guarantees that \mathcal{F}_- is a covariant transport representation for U^{\vee} . We may therefore assume without loss of generality that U and U^{\vee} coincide with the projection maps $\int_{\mathcal{C}} \mathcal{F}_+ \rightarrow \mathcal{C}$ and $\int_{\mathcal{C}} \mathcal{F}_- \rightarrow \mathcal{C}$, respectively.

We now proceed as in the proof of Proposition 8.6.3.23. Define a simplicial functor $\tau : \text{QCat}^{\prec} \rightarrow \text{QCat}$ as follows:

- On objects, τ is given by the construction $\mathcal{D} \mapsto \text{Tw}(\mathcal{D})$.

- On morphism spaces, τ is given by the morphism of simplicial sets

$$\begin{aligned}\mathrm{Hom}_{\mathrm{QCat}^{\simeq}}(\mathcal{D}, \mathcal{D}')_{\bullet} &= \mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq}) \\ &\rightarrow \mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathrm{Tw}(\mathcal{D}'))^{\simeq} \\ &= \mathrm{Hom}_{\mathrm{QCat}}(\mathrm{Tw}(\mathcal{D}), \mathrm{Tw}(\mathcal{D}'))_{\bullet}.\end{aligned}$$

which classifies the composition

$$\mathrm{Tw}(\mathcal{D}) \times \mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq}) \hookrightarrow \mathrm{Tw}(\mathcal{D} \times \mathrm{Fun}(\mathcal{D}, \mathcal{D}')) \xrightarrow{\mathrm{Tw}(\mathrm{ev})} \mathrm{Tw}(\mathcal{D}'),$$

where $\mathrm{ev} : \mathcal{D} \times \mathrm{Fun}(\mathcal{D}, \mathcal{D}') \rightarrow \mathcal{D}'$ is the evaluation map.

Let $\widetilde{\mathcal{F}} : \mathcal{C} \rightarrow \mathcal{QC}$ denote the diagram given by the composition $N_{\bullet}^{\mathrm{hc}}(\tau) \circ \mathcal{F}$, and set $\widetilde{\mathcal{E}} = \int_{\mathcal{C}} \widetilde{\mathcal{F}}$. There is a natural transformation of simplicial functors $\tau \rightarrow \pi' \times \pi$, which carries each ∞ -category \mathcal{D} to the left fibration $\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ of Proposition 8.1.1.11. Applying Corollary [?], see that this natural transformation induces a left fibration

$$\widetilde{\mathcal{E}} = \int_{\mathcal{C}} \widetilde{\mathcal{F}} \xrightarrow{\lambda} \int_{\mathcal{C}} (\mathcal{F}_- \times \mathcal{F}_+) \simeq \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}.$$

We will complete the proof by showing that λ exhibits U^{\vee} as a cocartesian dual of U : that is, it satisfies conditions (a) and (b) of Definition 8.6.3.1.

- (a) Fix a vertex $C \in \mathcal{C}$; we wish to show that the left fibration

$$\lambda_C : \{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \widetilde{\mathcal{F}} \rightarrow (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_-) \times (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_+)$$

is a balanced coupling. Set $\mathcal{D} = \widetilde{\mathcal{F}}(C)$. Using Example 5.7.2.18, we obtain a commutative diagram

$$\begin{array}{ccc}\mathrm{Tw}(\mathcal{D}) & \longrightarrow & \{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \widetilde{\mathcal{F}} \\ \downarrow & & \downarrow \lambda_C \\ \mathcal{D}^{\mathrm{op}} \times \mathcal{D} & \longrightarrow & (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_-) \times (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_+),\end{array}$$

where the horizontal maps are equivalences of ∞ -categories. The desired result now follows from the observation that the twisted arrow coupling $\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ is balanced (Example 8.2.6.2).

- (b) Let $U : \widetilde{\mathcal{E}} \rightarrow \mathcal{C}$ denote the projection map, let $f : X \rightarrow X'$ be a U -cocartesian edge of $\widetilde{\mathcal{E}}$, and let $\overline{f} : C \rightarrow C'$ denote the image of f in the simplicial set \mathcal{C} . The functor \mathcal{F}

carries the vertex C to an ∞ -category \mathcal{D} , C' to an ∞ -category \mathcal{D}' , and \bar{f} to a vertex of the Kan complex $\text{Tw}(\text{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq})$, which we can identify with an isomorphism $u : F_- \rightarrow F_+$ between functors $F_-, F_+ : \mathcal{D} \rightarrow \mathcal{D}'$. We can then identify X with a morphism $e : D_- \rightarrow D_+$ in the ∞ -category \mathcal{D} and X' with a morphism $e' : D'_- \rightarrow D'_+$ in the ∞ -category \mathcal{D}' , so that f determines a morphism in the ∞ -category $\text{Tw}(\mathcal{D}')$ which we depict informally in the diagram \mathcal{D}' which we depict informally in the diagram

$$\begin{array}{ccc} F_-(D_-) & \xleftarrow{\quad} & D'_- \\ \downarrow u(e) & & \downarrow e' \\ F_+(D_+) & \xrightarrow{\quad} & D'_+. \end{array}$$

Our assumption that X is universal for the coupling λ_C guarantees that e is an isomorphism in the ∞ -category \mathcal{D} (Example 8.2.1.5), so that the left vertical map is an isomorphism in the ∞ -category \mathcal{D}' . Our assumption that f is U -cocartesian guarantees that the horizontal maps in the diagram are also isomorphisms (Remark 5.7.2.14). It follows that e' is also an isomorphism in \mathcal{D}' , so that X' is universal for the coupling $\lambda_{C'}$ as desired.

□

04FM Remark 8.6.7.13. Let $\mathcal{QC}_{\text{Obj}}$ denote the ∞ -category of pairs (\mathcal{C}, X) , where \mathcal{C} is a small ∞ -category and X is an object of \mathcal{C} (see Definition 5.6.6.10). Then the identity functor $\text{id} : \mathcal{QC} \rightarrow \mathcal{QC}$ is a covariant transport representation for the universal cocartesian fibration

$$U : \mathcal{QC}_{\text{Obj}} \rightarrow \mathcal{QC} \quad (\mathcal{C}, X) \mapsto \mathcal{C}.$$

Applying Proposition 8.6.7.12, we deduce that the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ is a covariant transport representation for a cocartesian dual of the fibration U . By virtue of Corollary 5.7.5.13, this property characterizes the functor σ up to isomorphism.
